# 1 Product Overview

## 1.1 Outline

CW6686D is an MCS-51™ Compatible high performance mixed signal microcontroller. It integrates advanced digital and analog peripherals to suit for BT audio playback and BT Communicate applications.

## 1.2 Features

- CPU Compatible with MCS-51™ instruction set;
- Compliant to Bluetooth 3.0 + EDR, backward-compatible with BT1.2, 2.0 and 2.1
- Support SCMS-T content protection method;
- Support HFP v1.6, HSP v1.2, A2DP 1.3, AVCTP 1.4, AVDTP 1.3 and AVRCP 1.5
- Class 2 power level, RF Performance: Tx:0dBm, Rx: -80dBm;
- Support simple pairing and auto reconnection function;
- Support MP3/SBC decoder;
- Support two pairs of AUX;
- Six Channels 10-bit SARADC;
- support 16bit Mono DAC with >90dB SNR, embedded with four class A/B headphone amplifier
- 16bit Mono ADC with >90dB DR
- Support Audio record function to MIC ADPCM;
- Support Audio playback from SD/USB
- Keypad tone mixer;
- Two 8-bit timers, support Capture and PWM mode;
- Two 16-bit timers, support Capture and PWM mode;
- Watchdog Timer with on-chip RC oscillator;
- Support full-duplex IIS, UART, SPI, SD interface;
- Support IIC interface for FM function;
- 2 channels 16 levels Low Voltage Detector;
- Power on Reset
- Support Full speed USB 2.0 PHY;
- Full speed USB 2.0 HOST/DEVICE controller;
- IR controller;
- Independent powered Real-Time Clock supporting 32.768kHz crystal
- Internal crystal oscillator support 26M crystal
- Internal LDO regulator:1.35V to 1.2V;4.2V to 3.3V
- Built-in buck converter,DC-DC:4.2V to 1.35V

## 1.3 System Architecture

24	P33	I/O	GPIO ADC0/LVD dect ir_input 32K/xosc12m sys_clk_output TRM1CAP
25	P32	I/O	GPIO SDDAT0 SPI0DOUT3/DIN3
26	P31	I/O	GPIO SDCMD SPI0DIN3
27	P30	I/O	GPIO ADC4 SDCLK SPI0CLK3
28	N/C	N/C	N/C
29	N/C	N/C	N/C
30	N/C	N/C	N/C
31	PAD_VCC_IF	PWR	Power VCC
32	VCC_RF/VCC_PA	PWR	RF/PA Power VCC

Pin No.LQFP48	Name	Type	Function
33	GND_ANT1	GND	FR GND
34	RXTX	AI/	RF Rx and Tx pin
35	GND_ANT1	GND	RF GND
36	VCC_VCO	PWR	Power VCC
37	VCC_XO/ PAD_VDDQ	PWR	Power VCC/VDDQ
38	XO_P	A	BT 26MHz XOSC Positive Pin
39	XO_N	A	BT 26MHz XOSC Negative Pin
40	BVIN	PWR	PMU Power input Pin 4.2V(typ)
41	LX	A	Switch Node Connection to Inductor
42	BVSS	GND	GND
43	VOUT1V5	PWR	VOUT 1.5V
44	VDDCORE	PWR	Core power VDD 1.2V
45	RVDD	PWR	RF power VDD
46	VDDLDO	PWR	LDO power input 4.2V(typ)
47	VDDIO	PWR	Power output VDDIO 3.3V
48	USBDM	I/O	USB Negative Input/output

## 3 CPU Core Information

### 3.1 Architecture

The AXC51-CORE of CW6686D is fully compatible with the MCS-51™ instruction set.

The AXC51-CORE employs a pipelined architecture that greatly increases its instruction throughput over the standard 8051 architecture. In a standard 8051, all instructions except for MUL and DIV take 12 or 24 system clock cycles to execute, and usually have a maximum system clock of 12MHz. By contrast, the AXC51-CORE executes most of its instructions in 1 system clock cycle. With system clock running at 48 MHz, it has a peak throughput of 48 MIPS running in on-chip SRAM area.

### 3.2 Instruction Set

The instruction set of the AXC51-CORE is fully compatible with the standard MCS-51™ instruction set; standard 8051 development tools can be used to develop software for the AXC51-CORE. All instructions of AXC51-CORE are the binary and functional equivalent of their MCS-51™ counterparts, including op-codes, addressing modes and effect on PSW flags. However, instruction timing is different than that of the standard 8051. [Table 3-1](#) shows AXC51-CORE Instruction Set Summary

Table 3-1 AXC51-CORE Instruction Set Summary

Number of Bytes	Mnemonic	Operands	Clock Cycles (running in IRAM)
1	NOP		1
2	AJMP	code addr	3

1	CPL	A	1
2	MOV	data addr, A	1
1	MOV	@Ri, A	1
1	MOV	Rn, A	1

## 3.3 Memory Mapping

### 3.3.1 Program Memory Mapping

As illustrated in CW6686D program space is divided into 3 regions: SRAM1, SRAM2, and IROM.

Figure 3-1 Program Memory Organization

### 3.3.2 External Data Memory Mapping

*Figure 3-2* illustrated External Data Memory Mapping.

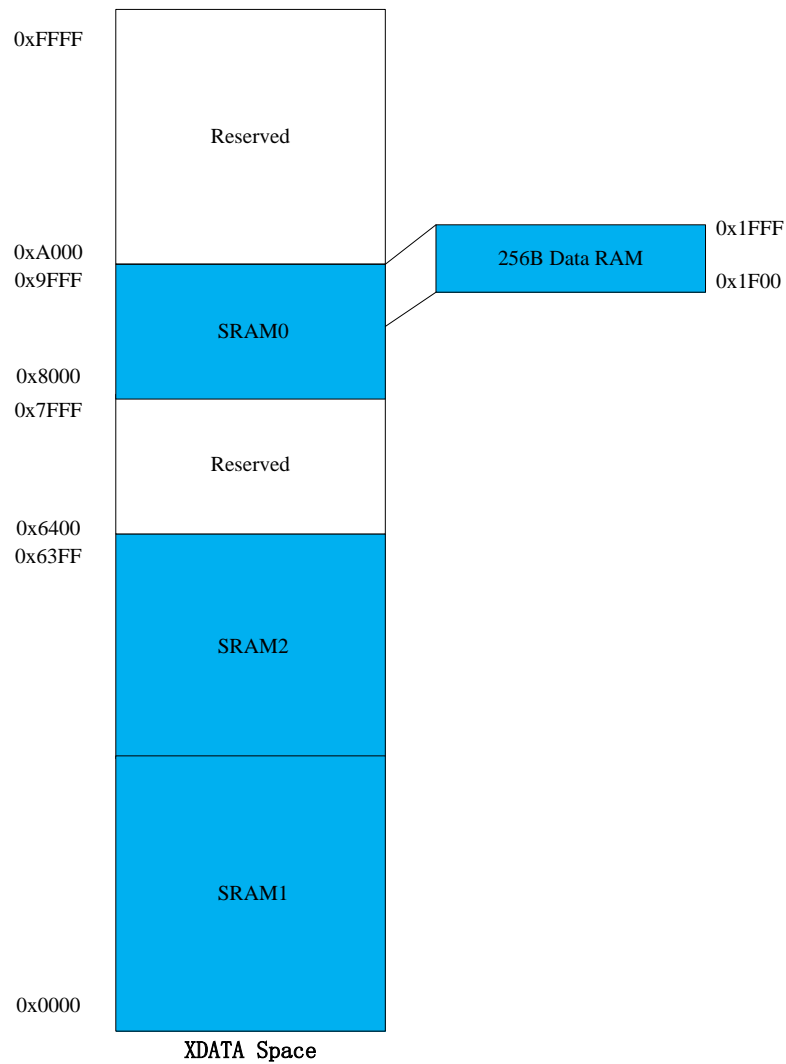

Figure 3-2 External Data Memory Mapping

### 3.3.3 Internal Data Memory Mapping

Internal data memory locates in SRAM0 at the address from 0x9F00 to 0x9FFF as showed in *Figure 3-2*. Internal data memory is mapped in *Figure 3-3*. The memory space is shown divided into three blocks, which are generally referred to as the Lower 128, the Upper 128, and SFR space.

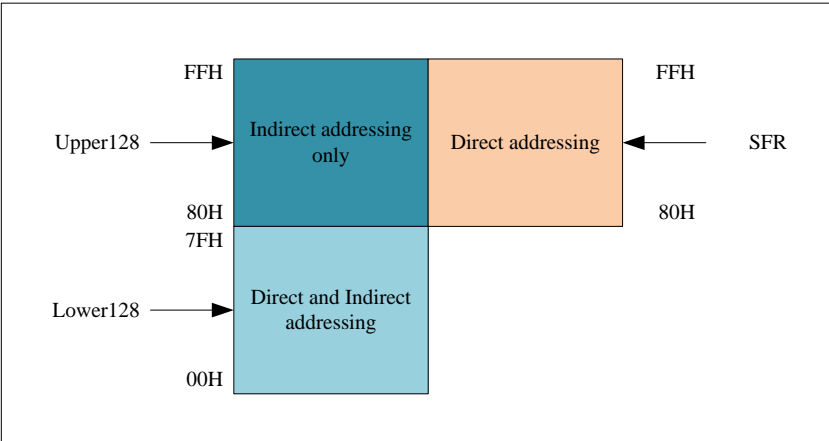

Figure 3-3 Internal data memory mapping

As shown in [Figure 3-4](#) the Lowest 32 bytes in Lower 128 are grouped into 4 banks of 8 registers. Program instructions call out these registers as R0 through R7. Two bits in the PSW select which register bank are in use.

Figure 3-4 Lowest 32 bytes in Internal data memory Lower 128

### 3.4 Interrupt Processing

#### 3.4.1 Interrupt sources

The CW6686D provides 15 interrupt sources. All interrupts are controlled by a series combination of individual enable bits and a global enable (EA) in the interrupt-enable register (IE0.7). Setting EA to logic 1 allows individual interrupts to be enabled. Setting EA to logic 0 disables all interrupts regardless of the individual interrupt-enable settings. The interrupt enables and priorities are functionally identical to those of the 80C52.

The CW6686D provides 3 sets of vectors entry addresses, starting from 0x0003, 0x4003 and 0x8003. The vector base address is set by DPCON [7:6]. [Table 3-2](#) lists the interrupt summary.

Table 3-2 Interrupt Summary

Interrupt Sources	Interrupt Vector	Interrupt Number	Natural Order	Interrupt Flag	Interrupt Enable Bit	Priority Control Bit
SINT0	0x0003 0x4003 0x8003	0	1	SPMODE.7	IE0.0	IPH0.0 IP0.0

SPI1	0x0073 0x4073 0x8073	14	15	SPI1CON.7	IE1.7	IPH1.7 IP1.7

### 3.4.2 Interrupt Priority

There are 4 levels of interrupt priority: Level 3 to 0. All interrupts have individual priority bits in the interrupt priority registers to allow each interrupt to be assigned a priority level from 3 to 0. All interrupts also have a natural hierarchy. In this manner, when a set of interrupts has been assigned the same priority, a second hierarchy determines which interrupt is allowed to take precedence. The natural hierarchy is determined by analyzing potential interrupts in a sequential manner with the order listed in [Table 3-2](#).

The processor indicates that an interrupt condition occurred by setting the respective flag bit. This bit is set regardless of whether the interrupt is enabled or disabled.

## 3.5 Special Function Register Mapping (SFR)

## 3.7 CPU and Memory related SFR Description

Register 3-1 DPCON – Data Pointer Configure Register

Position	7	6	5	4	3	2	1	0
Name	IA		DPID0	DPID1	DPAID	DPTSL	EINSTEN	DPSEL
Default	1	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**IA:** Select Interrupt Vector's Base Address

00 = Base address is 0x0003

01 = Base address is 0x4003

10 = Base address is 0x8003

11 = Base address is 0xc003

**note:** interrupt address is determined by SPMODE1[4]

0 = interrupt base address depend on IA

1 = interrupt base address is 0x2000

**DPID0:** DPTR0 increase direction control

0 = DPTR increase

1 = DPTR decrease

**DPID1:** DPTR1 increase direction control

0 = DPTR increase

1 = DPTR decrease

**DPAID:** DPTR auto increment enables

0 = Auto increment disable

1 = Auto increment enable

**DPTSL:** DPSEL toggle enable

0 = DPSEL toggle disable

1 = DPSEL toggle enable

**EINSTEN:** Extern instruction enables

0 = Disable

1 = Enable

**DPSEL:** DPTR Select

0 = Active DPTR0

1 = Active DPTR1

Data Pointer Register is an 16-bit address pointer, it can split up into two register, DPL and DPH. Data pointer register always used as indirect addressing register.

**Note:** interrupt address is determined by SPMODE1[4]

Register 3-2 DPL0 – Data Pointer Low Byte

Position	7	6	5	4	3	2	1	0
Name	DPL0							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 3-3 DPL1 – Data Pointer Low Byte

Position	7	6	5	4	3	2	1	0
Name	DPL1							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 3-4 DPH0 – Data Pointer High Byte

Position	7	6	5	4	3	2	1	0
Name	DPH0							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 3-5 DPH1 – Data Pointer High Byte

Position	7	6	5	4	3	2	1	0
Name	DPH1							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The data pointers (DPTR0 and DPTR1) are used to assign a memory address for the MOVX instructions. This address can point to a MOVX RAM location. Two pointers are useful when moving data from one memory area to another. The user can select the active pointer through a dedicated SFR bit (DPSEL: DPCON.0), or can activate an automatic toggling feature for altering the pointer selection (DPTSL: DPCON.2). An additional feature, if selected, provides automatic incrementing or decrementing of the current DPTR.

Data pointer increment/decrement bits DPID0 (DPCON.5) and DPID1 (DPCON.4) define how the INC DPTR instruction functions in relation to the active DPTR.

The CW6686D offers a programmable option that allows any instructions related to data pointer to toggle the DPSEL bit automatically. This option is enabled by setting the toggle-select-enable bit (DPTSL) to logic 1.

Once enabled, the DPSEL bit is automatically toggled after the execution of one of the following 5 DPTR related instructions:

MOVC A, @A+DPTR

MOVX A, @DPTR

MOVX @DPTR, A

INC DPTR

MOV DPTR, #data16

The CW6686D also offers a programmable option that automatically increases (or decreases) the contents of the selected data pointer by 1 after the execution of a DPTR-related instruction. The actual function (increment or decrement) is dependent on the setting of the DPAID bits. This option is enabled by setting the automatic increment/decrement enable (DPAID: DPCON.3) to a logic 1 and is affected by one of the following 3 DPTR-related instructions.

DPTR-related instructions are:

MOVC A, @A+DPTR

MOVX A, @DPTR

MOVX @DPTR, A

Register 3-6 SP – Stack Pointer Low Byte

Position	7	6	5	4	3	2	1	0
Name	SP							
Default	0	0	0	0	0	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 3-7 SPH – Stack Pointer High Byte

Position	7	6	5	4	3	2	1	0
Name	SPH							
Default	0	0	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

In a standard 8051, there is only an 8-bit stack pointer (SP). It can only use the internal 256 byte data memory as stack memory. To increase the stack space for more complex application, CW6686D supports a 16-bit extend stack pointer, it can use both internal data RAM and the 20K byte on-chip SRAM as stack memory. There are 2 registers for stack control.

Register 3-8 PSW – Processor Status Word

Position	7	6	5	4	3	2	1	0
Name	CY	AC	EC	RS1	RS0	OV	EZ	P
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**CY:** Carry Flag

**AC:** Auxiliary carry flag

**EC:** Extern instruction Carry flag

**RS1, RS0:** Register bank select

00 = bank0

01 = bank1

10 = bank2

11 = bank3

**OV:** Overflow flag

**EZ:** Extern instruction zero flag

**P:** Odd parity check of ACC

0 = There are even number of '1' bits in ACC

1 = There are odd number of '1' bits in ACC

#### Register 3-9 SPMODE – Special mode

Position	7	6	5	4	3	2	1	0
Name	SINT0	SINT1	PWRUP	RAM2CEM	DACRAMCEM	DECRAMCEM	IRAMCEM	IROMCEM
Default	0	0	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**SINT0:** Software 0 interrupts pending

0 = No software 0 interrupt

1 = Software 0 interrupt

**SINT1:** Software 1 interrupts pending

0 = No software 1 interrupt

1 = Software 1 interrupt

**PWRUP:** System power up flag

0 = CPU writes 0 to PWRUP.

1 = System power up or CPU writes 1 to PWRUP.

**RAM2CEM:** RAM2 CE mode control

0 = Always stay at 0

1 = Normal

**DACRAMCEM:** DAC RAM CE mode control

0 = Always stay at 0

1 = Normal

**DECRAMCEM:** DECRAM CE mode control

0 = Always stay at 0

1 = Normal

**IRAMCEM:** IRAM CE mode control

0 = Always stay at 0

1 = Normal

**IROMCEM:** IROM CE mode control

0 = Always stay at 0

1 = Normal

#### Register 3-10 SPMODE1 – Special mode 1

Position	7	6	5	4	3	2	1	0
----------	---	---	---	---	---	---	---	---

Name	SDADCADOUTEN	SDADCDIEN	SPI1_MAP	INTADR_SEL	PAPAMODE	SPIINITMODE	SBCDEC_MEN	MP3DEC_MEN
Default					0	0	1	1
Access	R/W	R/W	R/W	R/W	RO	RO	R/W	R/W

**SDADCADOUTEN:** SDADC analog data out enable

0 = disable

1 = enable

**SDADCDIEN:** SDADC digital data input enable

0 = disable

1 = enable

**SPI1\_MAP:** SPI1 port mapping

0 = Select P04, P05, P06

1 = Select P30, P31, P32

**INTADR\_SEL:** interrupt address select

0 = depend on DPCON IA

1 = 0x2000

**PAPAMODE :** papa mode

0 = normal mode

1 = Parallel mode

**SPIINITMODE :** SPI Flash initial mode

0 = normal mode

1 = SPI initial mode

**SBCDEC\_MEN:** SBC decoder module enables

0 = Disable

1 = Enable

**MP3DEC\_MEN:** MP3 decoder module enables

0 = Disable

1 = Enable

**Note:** SPMODE1[1:0] register can be write to "0", but can't be write to "1" after writing "0".

Register 3-11 MEMCON – Memory Mapping Configure

Position	7	6	5	4	3	2	1	0
Name						CC1		CC0
Default	0	0	0	0	0	0	0	0
Access	WO	WO	RO	R/W	R/W	R/W	R/W	R/W

**CC0:** MIX\_CODE2 mapping

0 = IROM32 map to address 0x4000~0x6fff

1 = SRAM2 map to address 0x4000~0x6fff

**CC1:** MIX\_CODE3 mapping

00 = IROM11 map to address 0xc000~0xffff

01 = IROM12 map to address 0xc000~0xffff

10 = IROM13 map to address 0xc000~0xffff

11 = IROM31 map to address 0xc000~0xffff

Register 3-12 IE0 – Interrupt Enable 0

Position	7	6	5	4	3	2	1	0
Name	EA	IE06	IE05	IE04	IE03	IE02	IE01	IE00
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**EA:** Global interrupt enable

0 = Disable

1 = Enable

**IE06:** USB SOF interrupt enable

0 = Disable

1 = Enable

**IE05:** Huffman/UART1 overflow interrupt enable

0 = Disable

1 = Enable

**IE04:** MP3 decoder and encoder interrupt enable

0 = Disable

1 = Enable

**IE03:** Timer2 interrupt enable

0 = Disable

1 = Enable

**IE02:** Timer1 interrupt enable

0 = Disable

1 = Enable

**IE01:** SINT1/AGC interrupt enable

0 = Disable

1 = Enable

**IE00:** SINT0 interrupt enable

0 = Disable

1 = Enable

Register 3-13 IE1 – Interrupt Enable 1

Position	7	6	5	4	3	2	1	0
Name	IE17	IE16	IE15	IE14	IE13	IE12	IE11	IE10
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**IE17:** SPI1 interrupt enable

0 = Disable

1 = Enable

**IE16:** RTCC/UART0/UART1/LVD/WDT/IIS interrupt enable

0 = Disable

1 = Enable

**IE15:** Timer0 interrupt enable

0 = Disable

1 = Enable

**IE14:** Timer 3 interrupt enable

0 = Disable

1 = Enable

**IE13:** SPI interrupt enable

0 = Disable

1 = Enable

**IE12:** Port interrupt enable

0 = Disable

1 = Enable

**IE11:** SDC interrupt enable

0 = Disable

1 = Enable

**IE10:** USB control interrupt enable

0 = Disable

1 = Enable

## Register 3-14 IPH0 – Interrupt Priority high 0

Position	7	6	5	4	3	2	1	0
Name	IPH07	IPH06	IPH05	IPH04	IPH03	IPH02	IPH01	IPH00
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

## 4 Reset Generation

### 4.1 Power-on Reset (POR)

CW6686D provides an on-chip Power-On-Reset (POR) circuit to detect power-on and to reset internal logic before VDD reaches the pre-determined POR threshold voltage. When VDD=1.2V, the POR threshold voltage is set to be about 0.7V~0.9V.

Sometimes, when the VDD is power-off and quickly power-on again, there might be cases that the POR will work improperly and internal reset might not be generated. For this reason, CW6686D POR circuit incorporates an internal self-reset module to discharge PORB output during power-off to ensure each power cycle will work properly.

However, it is also highly recommended user should have a long time between power-off and next power-on to ensure proper start-up. The time depends on actual system board environment and how much decoupling capacitors between power and ground. User has to take into account this effect during board level design.

*Figure 4-1* illustrates the power-on and reset signals waveform during proper power-on. Internally, there is TPOR and TRC time for both the POR circuit and the internal counter. TPOR is the time for the POR circuit to stay at zero voltage until it reaches VPOR and the time varies for different VDD rise-up time. It can be assumed to be about 2/3 of the VDD rise-up time. TRC is the time for internal counter to count 4ms using internal RC-oscillator when the counter sees a high logic from PORB signal. As a result, the overall internal reset time is the sum of TPOR and TRC. Such a long time is required to ensure the Power is stable for system use. It also ensures all internal logics are properly reset.

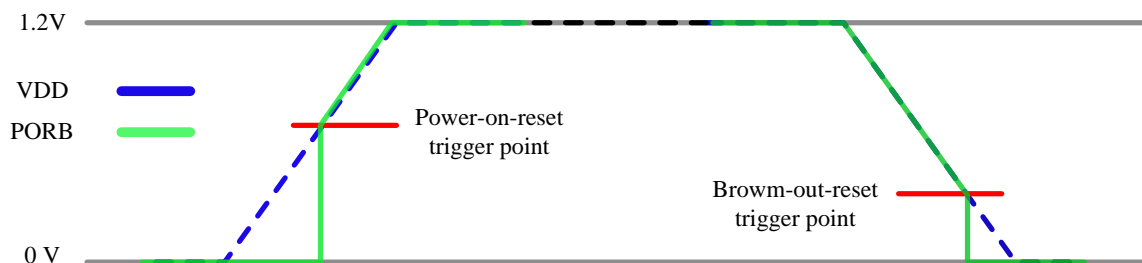

Figure 4-1 Power on reset

### 4.2 System Reset

All reset signals are OR'ed together inside the device to generate an overall system reset to reset the chip. Once reset, the program memory address is reset to 8000h, which is the start address of the Normal Mode. *Figure 4-2* illustrates the reset sources.

Figure 4-2 Reset Sources

### 4.2.1 LVD

CW6686D provides 4 levels programmable Low Voltage Detector (LVD) for user to detect VDDLDO power supply voltage or external pin voltage multiplexed with GPIO P3.3. It is for doing so since VDDLDO is the input voltage source for on-chip Low-Drop-Out regulator (LDO) and that supplies power to internal VDDCORE. User for such reason can momentarily monitor the VDDLDO power if externally connects to some batteries and detect if external power source starts dropping to a level that CW6686D LDO cannot tolerate and can do proper actions in the system program.

LVD can also be used to monitor external voltage source through the GPIO P3.3 to enhance programmability for different voltage levels. One of the examples can be used to monitor external power sources or batteries voltage or some voltages related to say pressure or temperature. It is there to provide a simple interface compared to ADC since ADC requires more programming space and procedures to detect precise voltage level. If user requires un-precise voltage detection without fine voltage range, LVD will be a good choice compared to ADC measurement. *Table 4-1* illustrates different voltage detection levels.

**Remark:**

- When LVD\_ENB is enabled, there is approximately 100us for the band-gap and the comparator to be stable before the end-user can use it as low voltage detection. During the time, LVD\_OEB has to be H in order to disable the LVD output with possibly fluctuating signal level.
- Different power supply falling time will affect the voltage detection. It is recommended that the power supply falling time should be larger than 1ms for stable low voltage detection.

Upon detection occurs, interrupt can be generated if LVD interrupt is enabled, or, CW6686D can undergo reset if interrupt is disabled.

Note that the detection is slightly dependent on power supply falling rate and noise fluctuation during power drop may alter the detection results. For this reason, internally the comparator has about 150mV hysteresis voltage level defined as  $V_{HYS} = V_{LVDR} - V_{LVDS}$  to filter out the noise may occur. Also, the detection level may have a maximum of 100mV difference compared to the value stated in [Table 4-1](#)

Table 4-1 LVD level setting

BORS[3:0]	Detected VDDLDO V	BORS[3:0]	Detected VDDLDO V
4'b0000	2.200	4'b1000	3.267

BORS[3:0]	Detected VDDLDO V	BORS[3:0]	Detected VDDLDO V
4'b0001	2.333	4'b1001	3.400
4'b0010	2.467	4'b1010	3.533
4'b0011	2.600	4'b1011	3.667
4'b0100	2.733	4'b1100	3.800
4'b0101	2.867	4'b1101	3.933
4'b0110	3.000	4'b1110	4.067
4'b0111	3.133	4'b1111	4.200

For the best operation, below shows a recommended operation for the LVD.

1. Select either VDDLDO or external pin to be monitored. Set VD1\_ENB = 0 for VDDLDO or VD2\_ENB = 0 for external pin
2. Select the detection voltage by setting bits BORS[3:0]
3. Enable the LVD by setting LVD\_ENB = 0
4. Wait for at least 30us for the internal band-gap and comparator to become stable
5. Enable the LVD output by setting LVD\_OEB = 0
6. The EX\_PIN detect voltage must be less than VDDIO

0 = When LVD threshold not detect. Cleared by writing a 0 to it

1 = When LVD threshold is detected

**LVD\_RSTEN:** LVD Reset enable bit.

0 = LVD Reset is disabled

1 = LVD is enabled

**LVD\_OE:** LVD output enable bit. Low active

0 = LVD output is enabled

1 = LVD output is disabled

## 4.2.2 RTCC Reset

CW6686D can be reset by RTCC second and alarm interrupt when IRTSTEN bit in RTCON is set to 1.

## 4.2.3 Watchdog Reset

If Watchdog timer is enabled, and WDTCON [5] is not written by 1 within watchdog overflow time period, CW6686D will be reset by Watchdog overflow.

## 4.2.4 Port Wakeup Reset

During SLEEP mode, port wakeup event will cause CW6686D reset.

## 4.3 Clock System

### 4.3.1 Clock Control

CW6686D embeds 32K/4M/12M/24M OSC internal oscillator circuits. External crystal is needed to generate a clock source. One internal PLL can generate 48MHz from the crystal clock source. One internal RC oscillator is also embedded.

To make sure the USB module operate properly, the USB clock must set to be 48MHz. In this case, system clock can be 48 MHz or 24MHz.

### 4.3.2 Clock Gating

CW6686D provides comprehensive clock gating options for eliminating power-wasting activities.

### 4.3.3 Phase Lock Loop (PLL)

CW6686D provides one on-chip Phase Locked Loop (PLL 48M) clock generators. The PLL has reference clock from external 32 KHz/4M/12 M crystal oscillators to provide a stable reference clock and the reference clock is multiplied to provide the final PLL output.

When the fraction is more than 0.80, set FOVER=1, and fraction = fraction/2, integer = integer

$FRAC = \text{fraction} * 65535$

#### User guide:

##### 1. PLL1 frequency division

PLL1 input reference clock is  $f_0$  (from RC or OSC), its internal dividing clock is 60M, frequency dividing ratio is  $60M/f_0$ .

Clock divide ratio consist of integer and decimal, the default value of integer part is 1831(default reference clock is 32.768k), the default value of decimal part is 0(only integral frequency division this time).

If  $f_0=32.768k$ , frequency dividing ratio is 1831, decimal fraction part set 0.

If  $f_0=12M$ , frequency dividing ratio is 5, decimal fraction part set 0.

If  $f_0=4M$ , frequency dividing ratio is 15, decimal fraction part set 0.

##### 2. If frequency dividing ratio is 58.a, then integer set 58, decimal fraction is $a*65535$ .

3. PLL2 same as PLL1

## 5 Low Power Management

### 5.1 Power Saving Mode

CW6686D device has the low power management mode that can help reducing power consumption when the device does not require intensive CPU resources and speed. There are four low power modes available: SLEEP mode, Hold mode, IDLE mode and power down mode.

#### 5.1.1 Sleep Mode

SLEEP mode is an ultimate power reduction mode that will stop all the clock sources, and all the memory chip select signals are disabled to further reduce power consumption. However, before entering sleep mode, all peripherals should be disabled separately, especially those analog peripherals and memory, unless those peripherals will stop themselves if no clock source is applied to the peripherals.

**Note:** Before Entering SLEEP mode, the system clock is recommended to change back to oscillator clock as the system clock.

To enter SLEEP mode, user need to write a '1' to SLEEP register (Bit0 of PCON0).

During SLEEP mode, the device can be wake up by either external port wakeup reset or watchdog reset or RTCC reset.

After exit SLEEP mode by wakeup, the device will be reset.

SLEEP mode will enable DEGRAM and IRAM and system clock automatically.

#### 5.1.2 Hold Mode

HOLD mode will stop the clock from entering to system. The system clock is gated with the HOLD mode control. Once enter HOLD mode, clock to the system logic halts. Therefore, there will be no clock switching entering the system logic so that power consumption is minimized due to no AC switching. However, the clock sources are not disabled and they are still running. This allows the clock to be resumed in real time without waiting for the PLL to lock again. Watchdog interrupt, RTCC interrupt, Port interrupt and all reset event will cause system to exit HOLD mode.

TO enter HOLD mode, user need to write a '1' to HOLD register (Bit1 of PCON0).

When wakeup from HOLD Mode by port or RTCC, if interrupt is enabled, CW6686D enters corresponding interrupt service subroutine (ISR), else CW6686D will execute the instruction following HOLD.

When wakeup from HOLD Mode by watchdog, if watchdog reset enable, CW6686D will be reset, else if watchdog interrupt is enabled, CW6686D will enter watchdog's ISR. Else CW6686D will execute the instruction following HOLD.

#### 5.1.3 Idle Mode

IDLE mode will stop the clock from entering to the CPU. The CPU clock is gated with the IDLE mode control. Once enter IDLE mode, clock to the CPU logic halts. Therefore, there will be no clock switching entering the CPU logic so CPU power consumption is minimized.

All interrupt sources will cause system to exit IDLE mode, which include all peripheral interrupt.

TO enter IDLE mode, user need to write a '1' to IDLE register (Bit2 of PCON0).

When exit IDLE mode, CW6686D will enter interrupt service subroutine if EA is enable. If EA is disabled, the instruction next to IDLE will be executed.

### 5.1.4 Power Down Mode

Power Down mode will disable core 1.2V and VDDIO 3.3V power, all the IO state, RAM, MROM and logic (except for IRTCC) will be power off. The content in RAM and logic disappears, should be initial after wake up.

#### Enter power down mode:

- 1) Disable the entire analog model
- 2) Select wake up source in WK\_EN
- 3) Disable RC, RVDD, VDD1P8, VDD3P3, PMU, in PWRCON (RTC power field); RCEN, RVDD\_EN, DVDD\_EN, VDDIO\_EN, PMU\_EN

#### Power down mode wake up source:

- 1) RTC alarm wake up
- 2) RTC WKO pin wake up
- 3) RTC every minute wake up
- 4) RTC every day wake up

**NOTE:** After exit Power Down mode by wakeup, the device will be reset.

## 5.2 Power Supply

CW6686D provides two on-chip low drop-out regulators (LDO) to convert from 5V to 3.3V, 1.5V to 1.2V for internal core power use. It is there to provide high power supply noise rejection and also to minimize power consumption. LDO is always enabled.

CW6686D also provides Build-in buck converter, DC-DC 5V to 1.5VV

To provide a more stable and reliable power source to internal core logic, it is recommended to add frequency compensation through external component.

#### Note:

- The recommended value for L0 is 10 uH.
- The recommended value for C0 is 10 uF.
- The recommended value for C1 is 10 uF.
- The recommended value for C2 is 10 uF.
- The recommended value for C3 is 10 uF.
- L0, Cx should be placed closely to the chip.

## 6 General Purpose Input/Output (GPIO)

### 6.1 Overview

The general purpose input/output port (GPIO) provides 30 dedicated general purpose one-bit contacts that can be individually configured as either inputs or outputs. Contacts configured as outputs reflect internal register values, and those configured as inputs can be detected by reading internal registers. All GPIOs are divided into 5 groups: Port0, Port1, Port2, Port3 and Port4 .

### 6.2 Features

The GPIO includes the following features:

- Drive specific data to output using the data register;
- Control the direction of the signal using the GPIO direction register;
- Enable CPU to sample the status of the corresponding inputs by reading the data register;
- Enable internal pull-up resistor using pull-up resistor control register;
- Select suitable pull-up resistor value;
- Enable internal pull-up resistor using pull-down resistor control register;
- Select suitable pull-down resistor value;
- Select suitable output driving current capability;

There are 5 types of GPIO that can meet the variation of application requirements. [Table 6-1](#) shows the difference between pad types

Table 6-1 Pad types

Type	Driving (mA)		Pull-up resistor (Kohm)			Pull-down resistor (Kohm)				Mode
A	8	24	10	/	/	10	/	/	/	Normal
B	8	24	10	0.2	/	10	0.2	/	/	Normal
C	8	24	10	200	0.5	10	3.3	0.5	/	Normal
D	8	24	10	/	/	10	/	/	/	MUTE
E	/	/	/	/	/	/	/	/	/	Analog

### 6.3 Function multiplexing

In order to provide more flexible port functions and to minimize pin counts, some of the ports are multiplexed with other peripherals or functions. [Table 6-2](#) illustrates the “Ports multiplexed mapping”.

Several GPIO are multiplexed with analog module. GPIO digital input and output must be disabled when the corresponding analog module is enabled.

Table 6-2 Ports multiplexed mapping

Pins	Func1	Func 2	Func3	Func4	Func5	Func6	Func7	Fun8	Type
P00	AUXL0	UARTRX1		SDDAT1		SPI0DIN2			A
P01	AUXR0	UARTTX1	PORTINT/WKUP0	SDDAT2					A
P02	AUXL1					SPI0DOUT1	TMR1PWM		A
P03	AUXR1					SPI0CLK1	TMR0CAP		A
P04						SPI1DOUT/DIN1			A
P05						SPI1CLK			A
P06			PORTINT/WKUP1			SPI1DIN/SPI0DIN1	TMR0CKI/TMR1CKI	IISDI0	A
P07			PORTINT/WKUP3	Ir_input			TRM1CAP		A
P10					EMIWR				C
P11									C
P12									C
P13	ADC5							IISBCLK0	B
P14	ADC2			SDDAT3		SPI0DOUT2	TMR3CAP/TMR3PWM	IISDO0	A
P15							TMR3CKI		B
P16		BTUART1TX	UARTTX0	Ir_input			TMR2CAP/TMR2PWM	IISREF	A
P17		BTUART1RX					TMR2CKI	IISWS0	B
P20	AUXL2			SDCMD	EMIDAT0				C
P21	AUXR2/ADC1			SDCLK	EMIDAT1				C
P22	ADC3/LVDIN				EMIDAT2			IISDO1	C
P23					EMIDAT3			IISDI1	C
P24					EMIDAT4				C
P25					EMIDAT5	SPI0DIN0/DOUT0		IISBCLK1	C
P26	ADC6				EMIDAT6	SPI0CLK0		IISWS1	C
P27				SDDAT0	EMIDAT7	SPI0DOUT0			C
P30	ADC4			SDCLK		SPI0CLK3			C
P31				SDCMD		SPI0DIN3			C
P32				SDDAT0		SPI0DOUT3/DIN3			C
P33	ADC0			Ir_input	32K/xosc12m	SysClk	TRM1CAP		A
P34		UARTRX0	PORTINT/WKUP2			SPI0CLK2	TMR0PWM		C
P35	MUTE								D
P36									A
P37	GPIO								B
P40				Ir_input		SPI0CLK4			A
P41									A
P42						SPI1DIN1'			A
P43									A
P44	DACL								E
P45	DACR								E

## 6.4 Port interrupt and wakeup

CW6686D supports Port interrupt and wakeup function.

The PWKEN registers (Wakeup Enable Register) allow Port to cause wakeup.

The PWKEN registers are set to 0Fh upon reset. Clearing bit0-3 in the PWKEN register enables wakeup on corresponding pin. The trigger condition on the selected pin can be either rising edge or falling edge. The WKED register (Wakeup Edge Select) selects the desired transition edge. Setting a bit in WKED register selects the falling edge of the corresponding pin. Resetting the bit selects the rising edge.

Once a valid transition occurs on the selected pin, the WKPND (PWKEN.7~PWKEN.4) register (Wakeup Pending Register) latches the transition in the corresponding bit position. Logic '1' indicates the occurrence of the selected trigger edge on the corresponding Port pins. Upon reset, logic '0' is set to all bits of WKPND.

**Note:**

1. To Wakeup initialization, to avoid any false signaling to port, the followings would be a recommended procedure for Wakeup initialization:
  - Configure the edge select of Port 0 pins on WKEDG register,
  - Clear the corresponding bits on WKPND Wakeup Pending Register
  - Clear the corresponding bits in the PWKEN registers to enable the wakeup on the corresponding port pins
2. Upon exiting the sleep down mode, the Multi-Input Wakeup logic causes full chip reset.

## 6.5 GPIO Special Function Registers

Register 6-1 P0DIR-P0 direction Register

Position	7	6	5	4	3	2	1	0
Name	P0DIR							
Default	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**P0xDIR:** P0x direction control

0 = Output

1 = Input

Register 6-2 P1DIR-P1 direction Register

Position	7	6	5	4	3	2	1	0
Name	P1DIR							
Default	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**P1xDIR:** P1x direction control

0 = Output

1 = Input

Register 6-3 P2DIR-P2 direction Register

Position	7	6	5	4	3	2	1	0
Name	P2DIR							
Default	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**P2xDIR:** P2x direction control

0 = Output

1 = Input

Register 6-4 P3DIR-P3 direction Register

Position	7	6	5	4	3	2	1	0
Name	P3DIR							
Default	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**P3xDIR:** P3x direction control

0 = Output

1 = Input

Register 6-5 P4DIR-P4 direction Register

Position	7	6	5	4	3	2	1	0
Name	P4DIR							
Default	-	-	1	1	1	1	1	1
Access	-	-	R/W	R/W	R/W	R/W	R/W	R/W

**P4xDIR:** P4x direction control

0 = Output

1 = Input

Register 6-6 P0 – P0 data register

Position	7	6	5	4	3	2	1	0
Name	P0							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

P0[x]: P0x data. Valid when P0x is used as GPIO

0 = P0x is in low state when read and output low at P0x when write

1 = P0x is in high state when read and output high at P0x when write

Register 6-7 P1 – P1 data register

Position	7	6	5	4	3	2	1	0
Name	P1							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

P1[x]: P1x data. Valid when P1x is used as GPIO

0 = P1x is in low state when read and output low at P1x when write

1 = P1x is in high state when read and output high at P1x when write

Register 6-8 P2 – P2 data register

Position	7	6	5	4	3	2	1	0
Name	P2							
Default	x	x	x	x	x	x	x	x
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

P2[x]: P2x data. Valid when P2x is used as GPIO

0 = P2x is in low state when read and output low at P2x when write

1 = P2x is in high state when read and output high at P2x when write

Register 6-9 P3 – P3 data register

Position	7	6	5	4	3	2	1	0
Name	P3							
Default	x	x	x	x	x	x	x	x
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

P3[x]: P3x data. Valid when P3x is used as GPIO

0 = P3x is in low state when read and output low at P3x when write

1 = P3x is in high state when read and output high at P3x when write

Register 6-10 P4 – P4 data register

Position	7	6	5	4	3	2	1	0
Name	P4							
Default	-	-	x	x	x	x	x	x
Access	-	-	RO	RO	W/R	W/R	W/R	W/R

P3[x]: P3x data. Valid when P3x is used as GPIO

0 = P3x is in low state when read and output low at P3x when write

1 = P3x is in high state when read and output high at P3x when write

Table 6-3 DRVx register setting

Register	Address	Set bit “x” of PxDRV0 as “1”	Clear bit “x” of PxDRV0 as “0”	Initial value
P0DRV0	R/W	Driving is 24mA	Driving is 8mA	00h
P1DRV0	R/W	Driving is 24mA	Driving is 8mA	00h
P2DRV0	R/W	Driving is 24mA	Driving is 8mA	00h
P3DRV0	R/W	Driving is 24mA	Driving is 8mA	00h
P4DRV0	R/W	Driving	Driving is 8mA	00h

Table 6-4 PUPx register setting

Register	Address	Set bit “x” of PxPU0 as “1”	Clear bit “x” of PxPU0 as “0”	Initial value
P0PU	R/W	Enable pull-up	Disable pull-up	00h

Register	Address	Set bit “x” of PxPU0 as “1”	Clear bit “x” of PxPU0 as “0”	Initial value
P1PU	R/W	Enable pull-up	Disable pull-up	00h
P2PU	R/W	Enable pull-up	Disable pull-up	00h
P3PU	R/W	Enable pull-up	Disable pull-up	00h
P4PU	R/W	Enable pull-up	Disable pull-up	00h

Table 6-5 PDNx register setting

Register	Address	Set bit “x” of PxPD0 as “1”	Clear bit “x” of PxPD0 as “0”	Initial value
P0PD	R/W	Enable pull-down	Disable pull-down	00h
P1PD	R/W	Enable pull-down	Disable pull-down	00h
P2PD	R/W	Enable pull-down	Disable pull-down	00h
P3PD	R/W	Enable pull-down	Disable pull-down	00h
P4PD	R/W	Enable pull-down	Disable pull-down	00h

**PWKEN1**

0 = Enable INT1 Wakeup

1 = Disable INT1 Wakeup

**PWKEN0**

0 = Enable INT0 Wakeup

1 = Disable INT0 Wakeup

**Note:**

1. to enable WKPNDx, set PWKENx to '0'.
2. To clear WKPNDx, write '0' to WKPNDx. WKPNDx will be '0' 2 clocks later after write '0' to WKPNDx.
3. WKPNDx is cleared when PWKENx is '1'.

Register 6-31 PWKEDGE – Port wakeup Event select

Position	7	6	5	4	3	2	1	0
Name	LDOBGOE	SPI0PS1	COSEL		WKEDG3	WKEDG2	WKEDG1	WKEDG0

Default	0	0	0	0	x	x	x	X
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**LDOBGOE:** LDO Bandgap output enable

0 = Disable

1 = Enable

**SPI0PS1:** SPI0 port select 1. See chapter 16 SPI0

**COSEL:** CLKO sources selection

00 = P3[3]

01 = PLL 12MHz

10 = System clock

11 = XOSCO

**WKEDGx:** Port interrupt Edge Select

0 = Select rising edge as interrupt trigger event

1 = Select falling edge as interrupt trigger event

## 6.6 Operation Guide

Port 0 to Port 3 are memory-mapped into the Data Memory addressing space. They are respectively mapped into 80h, 90h, A0h and B0h registers for ports P0, P1, P2 and P3. Writing to a port data register sets the voltage levels of the corresponding port pins that have been configured to operate as outputs. Reading from a data register reads the voltage levels of the corresponding port pins.

As illustrated in Figure 8-1, there are major differences reading the port values when the port is set as input and output. When the port is set as output, the CPU will read the port value from Px register instead of the port pin value. When the port is set as input, the CPU will read the value from port pin directly instead of the port value from Px register. As a result, the user should be very careful when using Read-then-Write instructions to access the ports and change PxDIR before write the output value to Px when using port as output. For example:

Code assembler:

```
ANL P0DIR, #0FEH
```

```
MOV P0, #01h
```

Code C51:

```
P0DIR &= 0Xfe;
```

```
P0 = 0x01;
```

The first instruction in this example configures P00 as output, and then the second instruction writes the Port 0 data register (P0), which controls the output levels of the Port 0 pins, P00 through P07. Figure 8-1 shows the internal hardware structure and configuration registers for each pin of Port 0~3.

## 7 Timers

### 7.1 Timer0

Timer0 is an 8-bit timer/counter with a 7-bit prescaler. It can be configured as timer, counter or PWM generator.

#### 7.1.1 Timer0 Features

- 8bits counter
- 7bits pre-scaler
- Counter mode (clock source from system clock or TMR0)
- Capture mode (event source from CAP0)
- PWM mode (PWM signal output to PWM0)

#### 7.1.2 Timer0 Special Function Registers

Register 7-1 TMR0CON – Timer0 control

Position	7	6	5	4	3	2	1	0
Name	T0PND	T0ES	T0M		T0IS	T0PSR		
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**T0PND:** Timer0 Pending Flag

0 = Not Pending

1 = Pending

**T0ES:** Timer0 Capture Mode Edge Select

0 = CAP0 Rising Edge

1 = CAP0 Falling Edge

**T0M:** Timer0 Mode

00 = Timer0 is disabled

01 = Timer0 is enabled and works in Counter Mode

10 = Timer0 is enabled and works in PWM Mode

11 = Timer0 is enabled and works in Capture Mode

**T0IS:** Timer0 Increase Source

0 = Select system clock cycle

1 = Select TMR0 rising edge

**T0PSR:** Timer0 Prescaler

000 = Timer0 counts at every counting source event

001 = Timer0 counts at every 2 counting source events

010 = Timer0 counts at every 4 counting source events

011 = Timer0 counts at every 8 counting source events

100 = Timer0 counts at every 16 counting source events

101 = Timer0 counts at every 32 counting source events

110 = Timer0 counts at every 64 counting source events

111 = Timer0 counts at every 128 counting source events

Register 7-2 TMR0CNT – Timer0 Counter

Position	7	6	5	4	3	2	1	0
Name	TMR0CNT							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Note:** Timer0 will increase in proper condition while it is enabled. It overflows when TMR0CNT = TMR0PR, TMR0CNT will be clear to 0x00 when overflow occurs, and the interrupt flag will be set '1' by hardware.

Register 7-3 TMR0PR – Timer0 Period

Position	7	6	5	4	3	2	1	0
Name	TMR0PR							
Default	1	1	1	1	1	1	1	1
Access	WO	WO	WO	WO	WO	WO	WO	WO

**Note:** The overflow period of the timer is:  $T_{inc-source} * T0PSR * (T0PR + 1)$ .

Register 7-4 TMR0PWM – Timer0 PWM duty

Position	7	6	5	4	3	2	1	0
Name	TMR0PWM							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Note:** TMR0PWM is reserved in timer/counter mode. In PWM mode, it is used as duty cycle setting. In capture mode, the value of TMR0CNT will be captured to TMR0PWM when selected event occurs.

## 7.2 Timer1

Timer1 is a 16-bit timer/counter with a 7-bit prescaler. It can be configured as timer, counter or PWM generator.

### 7.2.1 Timer1 Features

- 16bits counter
- 7bits pre-scaler
- Counter mode (clock source from system clock or TMR1)
- Capture mode (event source from CAP1)
- PWM mode (PWM signal output to PWM1)

## 7.2.2 Timer1 Special Function Registers

Register 7-5 TMR1CON0 – Timer1 control 0

Position	7	6	5	4	3	2	1	0
Name	T1ES		T1M		T1CPSEL	T1IS		
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**T1ES:** Timer1 Capture Edge Select

00 = CAP1 Rising Edge

01 = CAP1 Falling Edge

1X= CAP1 Rising Edge and Falling Edge

**T1M:** Timer1 Mode Select

00 = Timer1 is disabled

01 = Timer1 is enabled and works in Counter Mode

10 = Timer1 is enabled and works in PWM Mode

11 = Timer1 is enabled and works in Capture Mode

**T1CPSEL:** Timer1 capture input pin select

0 = Capture CAP1

1 = Capture IR1

**T1IS:** Timer1 Increase Source

000 = TMR1 Rising Edge

001 = TMR1 Falling Edge

010 = TMR1 Rising and Falling Edge

011 = External 32 KHz crystal oscillator

1xx = System clock cycle

Register 7-6 TMR1CON1 – Timer1 control 1

Position	7	6	5	4	3	2	1	0
Name	T1TPND	T1CPND	T1TIE	T1CIE	-	T1PSR		
Default	0	0	0	0	-	0	0	0
Access	R/W	R/W	R/W	R/W	-	R/W	R/W	R/W

**T1TPND:** Timer1 over Flow Pending Bit

0 = Not Pending

1 = Pending

**T1CPND:** Timer1 Capture mode Pending Bit

0 = Not Pending

1 = Pending

**T1TIE:** Timer1 over Flow Interrupt Enable Bit

0 = Interrupt Disable

1 = Interrupt Enable

**T1CIE:** Timer1 Capture mode Interrupt Enable Bit

0 = Disable

1 = Enable

**T1PSR:** Timer1 Prescaler

000 = Timer1 counts at every counting source event

001 = Timer1 counts at every 2 counting source events

010 = Timer1 counts at every 4 counting source events

011 = Timer1 counts at every 8 counting source events

100 = Timer1 counts at every 16 counting source events

101 = Timer1 counts at every 32 counting source events

110 = Timer1 counts at every 64 counting source events

111 = Timer1 counts at every 128 counting source events

Register 7-7 TMR1CNTH/TMR1CNTL – Timer1 Counter

Position	7	6	5	4	3	2	1	0
Name	TMR1CNTH/TMR1CNTL							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Note:** Timer1 will increase in proper condition while it is enable, it overflows when TMR1CNT = TMR1PR, TMR1CNT will be cleared to 0x0000 when overflow, and the interrupt flag will be set '1' by hardware.

Register 7-8 TMR1PRH/TMR1PRL – Timer1 Period

Position	7	6	5	4	3	2	1	0
Name	TMR1PRH/TMR1PRL							
Default	1	1	1	1	1	1	1	1
Access	WO	WO	WO	WO	WO	WO	WO	WO

The overflow period of the timer is: Tinc-source \* T1PSR \* (T1PR + 1).

Register 7-9 TMR1PWMH/TMR1PWML – Timer1 PWM duty

Position	7	6	5	4	3	2	1	0
Name	TMR1PWMH/TMR1PWML							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Note:** TMR1PWM is reserved in timer/counter mode. In PWM mode, it is used as duty cycle setting. In capture mode, the value of TMR1CNT will be captured to TMR1PWM when selected event occurs.

## 7.3 Timer2

Timer2 is a 16-bit timer/counter with a 7-bit prescaler. It can be configured as timer, counter or PWM generator.

### 7.3.1 Timer2 Features

- 16bits counter
- 7bits pre-scaler
- Counter mode (clock source from system clock or TMR2)
- Capture mode (event source from CAP2)
- PWM mode (PWM signal output to PWM2)

### 7.3.2 Timer2 Special Function Registers

Register 7-10 TMR2CON0 – Timer2 control 0

Position	7	6	5	4	3	2	1	0
Name	T2ES		T2M		Reserve	T2IS		
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**T2ES:** Timer2 Capture Edge Select

00 = CAP2 Rising Edge

01 = CAP2 Falling Edge

1X= CAP2 Rising Edge and Falling Edge

**T2M:** Timer2 Mode Select

00 = Timer2 is disabled

01 = Timer2 is enabled and works in Counter Mode

10 = Timer2 is enabled and works in PWM Mode

11 = Timer2 is enabled and works in Capture Mode

**T2IS:** Timer2 Increase Source

000 = TMR2 Rising Edge

001 = TMR2 Falling Edge

010 = TMR2 Rising and Falling Edge

011 = External 32 KHz crystal oscillator

1xx = System Clock cycle

Register 7-11 TMR2CON1 – Timer2 control 1

Position	7	6	5	4	3	2	1	0
Name	T2TPND	T2CPND	T2TIE	T2CIE	-	T2PSR		
Default	0	0	0	0	-	0	0	0
Access	R/W	R/W	R/W	R/W	-	R/W	R/W	R/W

**T2TPND:** Timer2 over Flow Pending Bit

0 = Not Pending

1 = Pending

**T2CPND:** Timer2 Capture mode Pending Bit

0 = Not Pending

1 = Pending

**T2TIE:** Timer2 over Flow Interrupt Enable Bit

0 = Interrupt Disable

1 = Interrupt Enable

**T2CIE:** Timer2 Capture mode Interrupt Enable Bit

0 = Disable

1 = Enable

**T2PSR:** Timer2 Prescaler

000 = Timer2 counts at every counting source event

001 = Timer2 counts at every 2 counting source events

010 = Timer2 counts at every 4 counting source events

011 = Timer2 counts at every 8 counting source events

100 = Timer2 counts at every 16 counting source events

101 = Timer2 counts at every 32 counting source events

110 = Timer2 counts at every 64 counting source events

111 = Timer2 counts at every 128 counting source events

Register 7-12 TMR2CNTH/TMR2CNTL – Timer2 Counter

Position	7	6	5	4	3	2	1	0
Name	TMR2CNTH/TMR2CNTL							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Note:** Timer2 will increase in proper condition while it is enable, it overflows when TMR2CNT = TMR2PR, TMR2CNT will be clear to 0x0000 when overflow, and the interrupt flag will be set '1' by hardware.

Register 7-13 TMR2PRH/TMR2PRL – Timer2 Period

Position	7	6	5	4	3	2	1	0
Name	TMR2PRH/TMR2PRL							
Default	1	1	1	1	1	1	1	1
Access	WO	WO	WO	WO	WO	WO	WO	WO

The overflow period of the timer is:  $T_{inc-source} * T2PSR * (T2PR + 1)$ .

Register 7-14 TMR2PWMH/TMR2PWML – Timer2 PWM duty

Position	7	6	5	4	3	2	1	0
Name	TMR2PWMH/TMR2PWML							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Note:** TMR2PWM is reserved in timer/counter mode. In PWM mode, it is used as duty cycle setting. In capture mode, the value of TMR2CNT will be captured to TMR2PWM when selected event occurs.

## 7.4 Timer3

Timer3 is an 8-bit timer/counter with a 7-bit prescaler. It can be configured as timer, counter or PWM generator.

### 7.4.1 Timer3 Features

- 8bits counter
- 7bits pre-scaler
- Counter mode (clock source from system clock or TMR3)
- Capture mode (event source from CAP3)
- PWM mode (PWM signal output to PWM3)

### 7.4.2 Timer3 Special Function Registers

Register 7-15 TMR3CON – Timer3 control

Position	7	6	5	4	3	2	1	0
Name	T3PND	T3ES	T3M		T3IS	T3PSR		
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**T3PND:** Timer3 Pending Flag

0 = Not Pending

1 = Pending

**T3ES:** Timer3 Capture Mode Edge Select

0 = CAP3 Rising Edge

1 = CAP3 Falling Edge

**T3M:** Timer3 Mode

00 = Timer3 is disabled

01 = Timer3 is enabled and works in Counter Mode

10 = Timer3 is enabled and works in PWM Mode

11 = Timer3 is enabled and works in Capture Mode

**T3IS:** Timer3 Increase Source

0 = System Clock

1 = TMR3 rising edge

**T3PSR:** Timer3 Prescaler

000 = Timer3 counts at every counting source event

001 = Timer3 counts at every 2 counting source events

010 = Timer3 counts at every 4 counting source events

011 = Timer3 counts at every 8 counting source events

100 = Timer3 counts at every 16 counting source events

101 = Timer3 counts at every 32 counting source events

110 = Timer3 counts at every 64 counting source events

111 = Timer3 counts at every 128 counting source events

Register 7-16 TMR3CNT – Timer3 Counter

Position	7	6	5	4	3	2	1	0
Name	T3CNT							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Note:** Timer3 will increase in proper condition while it is enabled. It overflows when TMR3CNT = TMR3PR, TMR3CNT will be clear to 0x00 when overflow occurs, and the interrupt flag will be set '1' by hardware.

Register 7-17 TMR3PR – Timer3 Period

Position	7	6	5	4	3	2	1	0
Name	TMR3PR							
Default	1	1	1	1	1	1	1	1
Access	WO	WO	WO	WO	WO	WO	WO	WO

**Note:** The overflow period of the timer is: Tinc-source \* T3PSR \* (T3PR + 1).

Register 7-18 TMR3PWM – Timer3 PWM duty

Position	7	6	5	4	3	2	1	0
Name	TMR3PWM							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Note:** TMR3PWM is reserved in timer/counter mode. In PWM mode, it is used as duty cycle setting. In capture mode, the value of TMR3CNT will be captured to TMR3PWM when selected event occurs.

## 7.5 Watchdog Timer (WDT)

The Watchdog Timer (WDT) logic consists of a 20bit Watchdog Timer. The Watchdog Timer is clocked by internal RC oscillator running at 32 KHz. When device resets, the WDT is disabled and user should enable the WDT if it is needed.

In the default configuration, WDT overflows in 2ms. The application program needs to write a '1' into WDTCON [5] at least once 2 ms to prevent WDT time out. The lower 3 bits of the WDTCON register control the selection of overflow time period.

### 7.5.1 Watchdog Wake up

WDT can be used to wake up CW6686D from Idle, Hold or Sleep mode. RSTEN bit (WDTCON [3]) is used to determine the actions after WDT wake up. When RSTEN sets to 0, the watchdog will generate a non-reset wake up after counter overflows. And When RSTEN sets to 1, the watchdog will wake up CW6686D by resetting the whole chip. After non-reset wake up CW6686D will continue to execute next instruction.

- During Idle mode, CW6686D can be wake up by WDT with interrupt or reset.
- During Hold mode, CW6686D can be wakeup by WDT with interrupt or reset or just continue to execute the

next instruction.

- During Sleep mode, CW6686D can be wakeup by WDT with reset.
- During Deep Sleep mode, CW6686D cannot be wakeup by WDT.

## 7.5.2 Watchdog SFR

Register 7-19 WDTCON – Watchdog control

Position	7	6	5	4	3	2	1	0
Name	WDTPD	WDTTO	CLRWDT	WDTEN	RSTEN	WDTPS		
Default	0	0	0	1	1	1	0	1
Access	RO	RO	WO	R/W	R/W	R/W	R/W	R/W

### WDTPD:

0 = read '0' before sleep operation

1 = read '1' after sleep operation

### WDTTO:

0 = Read '0' after clear Watchdog or Power up

1 = Read '1' after Watchdog time out

### CLRWDT:

1 = Clear WDT counter

0 = No action

### WDTEN:

0 = Disables the Watchdog timer

1 = Enables the Watchdog timer

### RSTEN:

0 = Disables the Watchdog reset

1 = Enables the Watchdog reset

### WDTPS: WDT time out period setting

000 = 2ms

001 = 8ms

010 = 32ms

011 = 128ms

100 = 512ms

101 = 2048ms

110 = 8192ms

111 = 32768ms

## 7.6 Independent Power Real Time Clock Counter (IRTCC)

### 7.6.1 IRTCC Controller

IRTCC control can generate two interrupts: Second interrupt and Alarm interrupt.

IRTCC second interrupt can be enabled by writing 1 to IRTIE bit. When IRTCC works and IRTIE = 1, IRTCC second interrupt will be generated every 1 second by setting IRTPNPND to 1. IRTPNPND can be cleared by software by writing 0 to IRTPNPND bit.

IRTCC alarm interrupt can be enabled by writing 1 to IRTALIE bit. When IRTCC works and IRTALIE = 1, IRTCC alarm interrupt will be generated when the current time is equal to the pre-set time by setting IRTALPNPND to 1. IRTALPNPND can be cleared by software by writing 0 to IRTALPNPND bit.

IRTCC is divided to two parts; one part is IRTCC control. The power of IRTCC control is VDDCORE. Another part is IRTCC. The part of IRTCC is VDDRTC. The communication between two parts is use like SPI protocol.

### 7.6.2 IRTCC Timer

IRTCC timer can be power independently. It can work even other logic in CW6686D power off.

There is 6-bit valid address for the 64-byte user RAM. So the upper 2-bit of address in the writing RTC\_RAM or reading RTC\_RAM command are ignored. After one byte write/read, the internal address can increase automatically, this characteristic provide a burst mode to write/read the RAM. If the internal addresses increase greater than 63, it will roll back to 0.

### 7.6.3 Communication with IRTCC Timer

Special commands and corresponding parameters are used to communicate with IRTCC timer internal control or status registers and SRAM.

Table 7-1 IRTCC components communication commands

IRTCC component	Component type	Operation	Command Code	Command Parameters
Write_CFG(RTCCON)	A	Write	0x55	One byte
Read_CFG(RTCCON)	A	Read	0x54	One byte
Write_CFG3(RTCC3)	A	Write	0x59	One byte
Write_RTC	B	Write	0xF0	Four byte
Read_RTC	B	Read	0xE0	Four byte
Write_ALM	B	Write	0x53	Four byte
Read_ALM	B	Read	0x52	Four byte
Write_RAM	C	Write	0x57	One byte address and N byte data
Read_RAM	C	Read	0x56	One byte address and N byte data
Write_PWR(PWRCON)	A	Read	0x5a	One byte
Write_WKO(WKOCON)	A	Write	0x5b	One byte
Read_WKO(WKOCON)	A	Read	0xa1	One byte

IRTCC component	Component type	Operation	Command Code	Command Parameters
Write_VCL(VOLTAGE)	A	Write	0xa2	One byte
Read_VCL(VOLTAGE)	A	Read	0xa3	One byte
Read_PWR(PWRCON)	A	Read	0x65	One byte
Write_STA(WKSTA)	A	Write	0x63	One byte
Read_STA(WKSTA)	A	Read	0x62	One byte

**Communication operations:**

1, Read or write A type components

Write:

Read:

2, Read or write B type components

Write:

Read:

3, Read or write C type components

Write:

Read:

#### 7.6.4 IRTCC Special Function Registers

### Register 7-20 IRTCON – IRTCC control

Position	7	6	5	4	3	2	1	0
Name	IRTCSTEN	Reserved	IRTALPND	IRTALIE	IRTPND	IRTIE	DONE	EN
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**IRTCSTEN:** IRTCC sleep wake up enable

0 = Disable

1 = Enable

**IRTALPND:** IRTCC alarm pending

0 = No pending (Write 0 to clear pending)

1 = Pending

**IRTALIE:** IRTCC alarm interrupt enable

0 = Disable

1 = Enable

IRTALIE must be '1' if IRTCC alarm is used to wake up system.

**IRTPND:** IRTCC second pending

0 = No pending (Write 0 to clear pending)

1 = Pending

**IRTALIE:** IRTCC alarm second enable

0 = Disable

1 = Enable

IRTIE must be '1' if IRTCC second is used to wake up system.

**DONE:** Communication done flag

0 = done

1 = not done

**EN:** IRTCC communications enable

0 = Disable

1 = Enable

Register 7-21 IRTCDAT – RTCC communication data

Position	7	6	5	4	3	2	1	0
Name	IRTCDAT							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Write to IRTCDAT will start IRTCC communication and set DONE flag to 1.

Read IRTCDAT will return IRTCC data.

Register 7-22 SECCNT –IRTCC timer counter

Position	7	6	5	4	3	2	1	0
Name	SECCNT7	SECCNT6	SECCNT5	SECCNT4	SECCNT3	SECCNT2	SECCNT1	SECCNT0
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

RTCC second counter

Register 7-23 IRTCON1 – RTCC control1

Position	7	6	5	4	3	2	1	0
Name	-	-	-	-	RTC_POR	IRTCC_POR_EN	TIMER	TIMERIE
Default	-	-	-	-		0	0	0
Access	-	-	-	-	R/O	R/W	R/W	R/W

**RTC\_POR** : RTCC POR bit

0 = RTCC POR be 0

1 = RTCC POR be 1

**NOTE** : only design specification can be known.

**IRTCC\_POR\_EN**: IRTCC POR reset system clock enable

0 = Disable

1 = Enable

**TIMER**: Timer pending

0 = No pending (Write 0 to clear pending)

1 = When SECCNT equal to internal counter

**TIMERIE**: Timer pending interrupt enable

0 = Disable

1 = Enable

Register 7-24 RANDOM\_CNT – random center regent

Position	7	6	5	4	3	2	1	0
Name	RANDOM_CNT[7:0]							

Default	-	-	-	-	-	-	-	-
Access	RO	RO	RO	RO	RO	RO	RO	RO

**RANDOM** : random center of 32k without default value

## 7.6.5 IRTCC components description

IRTCC timer can be power independently. It can work even other logic in TIGER is power off.

In IRTCC timer, there are one 8-bit configure register, one 32-bit real time counter, one 32-bit alarm register and 64-byte user RAM. All of these can be access (read or write) by several command sets through the IRTCC control.

There is 6-bit valid address for the 64-byte user RAM. So the upper 2-bit of address in the Write\_RAM or Read\_RAM command are ignored. After one byte write/read, the internal address can increase automatically, this characteristic provide a burst mode to write/read the RAM. If the internal address increase greater than 63, it will roll back to 0.

Register 7-25 RTCCON - RTCC control

Position	7	6	5	4	3	2	1	0
Name	32K_EN	12M_EN	WPOR_EN	WKO_CIN	F1HZEN	F32KHZEN	EX32KSEL	WKO32KOUT
Default	0	0	0	x	1	1	0	0
Access	R/W	R/W	R/W	RO	R/W	R/W	R/W	R/W

**32K\_EN** : xosc 32k enable

0 = Disable

1 = Enable

**12M\_EN** : xosc 12m enable

0 = Disable

1 = Enable

**WPOR\_EN**: wait system reset enable

0 = disable

1 = enable

**WKO\_CIN**: wko pin state read

**F1HZEN**: 1Hz signal output enable

0 = Disable

1 = Enable

**F32KHZEN**: 32KHz signal output enable

0 = Disable

1 = Enable

**EX32KSEL**: RTCC timer clock source select

0 = RTCC timer works with XOSC 32K.

1 = RTCC timer works with IRTOSC 32KHz

**WKO32KOUT**: WKO output RTC analog 32K XOSC

0 = Disable

1 = Enable

Register 7-26 RTCC3 - RTCC configure register3

Position	7	6	5	4	3	2	1	0
Name	-	-	-	XOSC_SHP_RTC	RFB_SEL_RTC	PDNEN	DRSEL	
Default	-	-	-	0	0	1	0	0
Access	-	-	-	WO	WO	WO	WO	WO

**XOSC\_SHP\_RTC:** XOSC shaping method select

0 = comparator

1 = Schmitt trigger

**RFB\_SEL\_RTC:** 32K XOSC feedback resistor select

0 = disable

1 = enable

**PDNEN:** pull down enable

0 = disable

1 = enable

**DRSEL :** IRTCC OSC drive select

Register 7-27 PWRCON - Power control register

Position	7	6	5	4	3	2	1	0
Name	PD_FLAG	BIAS_SEL		BUCK_MODE_SEL	RVDD_EN	DVDD_EN	VDDIO_EN	PMU_EN
Default	1	1	1	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**PD\_FLAG:** Power down flag

0 = not first power up

1 = first power up

**BIAS\_SEL[1:0]:** LDO amp bias current selection

00 = X0

01 = X1

10 = X2, default

11 = X4

**BUCK\_MODE\_SEL:** PMU mode select bit

0 = LDO mode

1 = BUCK mode

**RVDD\_EN:** RVDD enable bit

0 = enable

1 = disable

**DVDD\_EN:** DVDD enable bit

0 = enable

1 = disable

**VDDIO\_EN:** VDDIO enable bit

0 = enable

1 = disable

**PMU\_EN:** PMU enable bit

0 = enable

1 = disable

Register 7-28 WKOCON - WKO control register

Position	7	6	5	4	3	2	1	0
Name	WKPIN_STA	FLTEN	ALMOE	WKOEN	WKOUTEN	WKOINEN	ALMEN	ALMOT
Default	0	0	0	0	0	0	0	X
Access	R/W	W/R	W/R	W/R	W/R	W/R	R/W	R/O

**WKPIN\_STA:** Wake up pin output state

0 = wake up pin output 0

1 = wake up pin output 1

**FITEN:** WKO 1ms filter enable

0 = disable

1 = enable

**ALMOE:** Alarm output enable at WKO PIN output enable

0 = Disable

1 = Enable

**WKOEN:** WKO PIN enable

0 = Disable

1 = Enabled

**WKOUTEN:** WKO PIN output enable bit

0 = Disable

1 = Enabled

**WKOINEN:** WKO PIN input enable bit

0 = Disable

1 = Enabled

**ALMEN:** Alarm function enable

0 = Disable

1 = Enable

**ALMOT:** Alarm match flag.

0 = No alarm match happen

1 = Alarm match

This flag is set to '1' by hardware when alarm register match real timer counter. It can be clear to '0' if ALMEN is set to '0' or 'Write\_ALM' is detected.

Register 7-29 WKSTA - Wake up status register

Position	7	6	5	4	3	2	1	0
Name				HVDS	HVDR	LVDPND	WKOPND	ALMOT
Default	0	0	0	0	1	0	0	0
Access	R	R	R	R	R	R/W	R	R

**HVDS:** HVD level select

0 = 4.0V

1 = 4.2V

**HVDR:** HVD flag

0 = VDDLDO is no higher than configuration

1 = VDDLDO is higher than configuration

**LVDPND:** LVD pending

0 = VDDLDO is higher than 2V

0 = VDDLDO is lower than 2V

Write this bit 0 will clear LVDPND

**WKOPND:** IRTWKO wake up pending

0 = No wakeup

1 = IRTWKO pin wake up pending

**ALMOT:** Alarm match flag.

0 = No alarm match happen

1 = Alarm match

Register 7-30 VCL VOLTAGE configure register

Position	7	6	5	4	3	2	1	0
Name	SC_RTC[4]	SC_RTC[3]	SC_RTC[2]	SC_RTC[1]	SC_RTC[0]	HVDS/ VDDIO_EN	HVDEN	LV DEN
Default	1	1	0	1	0	0	0	0
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

**SC\_RTC [4]:** OSCO OSCI capacitance select

**SC\_RTC [3:2]:** OSCO capacitance select

**SC\_RTC [1:0]:** OSCI capacitance select

**HVDS/ VDDIO\_EN:**

**When write this bit, will write HVDS.** HVD level select

0 = 4.0V

1 = 4.2V

**When read this bit, will read VDDIO\_EN**

**HVDEN:** HVD enable bit

0 = Disabled

1 = Enabled

**LV DEN:** LVD enable bit

0 = Disabled

1 = Enabled

In IRTCC timer, there is one 32-bit real time counter. The unit of this counter is per second. If display the time on LCD, you should convert to second, minute, hour, date and so on. When use "Write\_RTC" command to config this counter, the first byte is config the highest counter, and the forth byte is config the lowest counter. When use "Read\_RTC" command to read this counter, the first byte output is the highest counter, and the forth byte output is the lowest counter.

In IRTCC timer, there is one 32-bit alarm register. The unit of this counter is per second. If display the time on LCD, you should convert to second, minute, hour, date and so on. When use "Write\_ALM" command to config this counter, the first byte is config the highest counter, and the forth byte is config the lowest counter. When use "Read\_ALM" command to read this counter, the first byte output is the highest counter, and the forth byte output is the lowest counter.

## 7.6.6 IRTCC Operating Guide

## 8 Universal Asynchronous Receiver/Transmitter (UART)

### 8.1 UART0

#### 8.1.1 Overview

UART0 is a serial port capable of asynchronous transmission. The UART0 can function in full duplex mode. Receive data is buffered in a holding register. This allows the UART0 to start reception of a second incoming data byte before software has finished reading the previous data byte. 错误！未找到引用源。 illustrates the UART0 Block Diagram.

When PSEL = 0

- Receive pin (RX) – UART0RX0
- Transmit pin (TX) – UART0TX0

When PSEL = 1

- Receive pin (RX) – UART0RX1
- Transmit pin (TX) – UART0TX1

#### 8.1.2 UART0 Special Function Registers

Register 8-1 UARTCON – UART0 control

Position	7	6	5	4	3	2	1	0
Name	UTSBS	UTTXNB	NBITEN	UTEN	UTTXINV	UTRXINV	TXIE	RXIE
Default	0	1	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**UTSBS:** Stop Bit Select

0 = 1 bit as Stop Bit

1 = 2 bits as Stop Bit

**UTTXNB:** The ninth bit data of transmitter buffer. Write the ninth bit into this location that you want to transmit

**NBITEN:** Nine-BIT mode Enable Bit

0 = Eight-bit mode

1 = Nine-bit mode

**UTEN:** UART Enable Bit

0 = Disable UART module

1 = Enable UART module

**UTTXINV:** Transmit Invert Selection Bit

0 = Transmitter output without inverted

1 = Transmitter output inverted

**UTRXINV:** Receive Invert Selection Bit

0 = Receiver input without inverted

1 = Receiver input inverted

**TXIE:** Transmit Interrupt Enable

0 = Transmit interrupt disable

1 = Transmit interrupt enable

**RXIE:** Receive Interrupt Enable

0 = Receiver interrupt disable

1 = Receiver interrupt enable

Register 8-2 UARTSTA – UART0 status

Position	7	6	5	4	3	2	1	0
Name	UTRXNB	FEF	RXIF	TXIF	-	-	-	PSEL
Default	x	x	0	1	-	-	-	0
Access	R/W	R/W	R/W	RO	-	-	-	R/W

**UTRXNB:** The ninth bit data of receiver buffer

**FEF:** Frame Error Flag

0 = the stop bit is '1' in the last received frame

1 = the stop bit is '0' in the last received frame

**RXIF:** RX Interrupt Flag

0 = RX not done

1 = RX done

**TXIF:** TX Interrupt Flag

0 = TX not done

1 = TX done

Writing data to UTBUF will clear this flag.

**PSEL:** UART0 Port Select

0 = Select UART0RX0 and UART0TX0

UART0RX0: P34

UART0TX0: P16

1 = Select UART0RX1 and UART0TX1

UART0RX1: P00

UART0TX1: P01

Register 8-3 UARTBAUDL – UART0 Baud Rate Low Byte

Position	7	6	5	4	3	2	1	0
Name	UARTBAUDL							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Register 8-4 UARTBAUDH – UART0 Baud Rate High Byte

Position	7	6	5	4	3	2	1	0
Name	UARTBAUDH							
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

UARTBAUD = {UARTBAUDH, UARTBAUDL}

Register 8-5 UARTDIV

Position	7	6	5	4	3	2	1	0
Name	UARTDIV							
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

Baud Rate =  $F_{\text{sys clock}} / [(UARTBAUD + 1) \times (UARTDIV + 1)]$

Register 8-6 UARTDATA – UART0 Data

Position	7	6	5	4	3	2	1	0
Name	UARTDATA							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Write this location will load the data to transmitter buffer. And read this location will read the data from the receiver buffer.

## 8.2 UART1

### 8.2.1 Overview

UART1 is a serial port capable of asynchronous transmission. The UART1 can function in normal and DMA full duplex mode. Please see PMUXCON0 bit 6 descriptions

when PMUXCON0[6] == 0

- Receive pin (RX) – UART1RX0 (P17)
- Transmit pin (TX) – UART1TX0 (P16)

Or PMUXCON0[6] == 1

- Receive pin (RX) – UART1RX1 (BT\_TX)
- Transmit pin (TX) – UART1TX1 (BT\_RX)

### 8.2.2 UART1 Special Function Registers

Register 8-7 UART1CON – UART1 control

Position	7	6	5	4	3	2	1	0
Name	UTSBS	UTTXNB	NBITEN	UTEN	TXIE	RXIE	OVERFLOWIE	DMASEL
Default	0	1	0	0	0	0	-	0

Access	R/W	R/W	R/W	R/W	R/W	R/W	-	R/W
--------	-----	-----	-----	-----	-----	-----	---	-----

**UTSBS:** Stop Bit Select

0 = 1 bit as Stop Bit

1 = 2 bits as Stop Bit

**UTTXNB:** The ninth bit data of transmitter buffer. Write the ninth bit into this location that you want to transmit

**NBITEN:** Nine-BIT mode Enable Bit

0 = Eight-bit mode

1 = Nine-bit mode

**UTEN:** UART Enable Bit

0 = Disable UART module

1 = Enable UART module

**TXIE:** Transmit Interrupt Enable

0 = Transmit interrupt disable

1 = Transmit interrupt enable

**RXIE:** Receive Interrupt Enable

0 = Normal Receive interrupt disable or AUTO DMA mode Receive one word Interrupt disable

1 = Normal Receive interrupt enable or AUTO DMA mode Receive one word Interrupt enable

**OVERFLOWIE:** Receive DMA overflow interrupt enable

0 = overflow Interrupt disable

1 = overflow Interrupt enable

**DMASEL:** AUTO DMA choose

0 = AUTO DMA mode off

1 = AUTO DMA mode on

Register 8-8 UART1STA – UART1 status

Position	7	6	5	4	3	2	1	0
Name	UART_GIIE	-	UTRXNB	RX_BYTE_HIGH	RXIF	TXIF	OVERFLOWIF	RXKICK
Default	0	-	x	0	0	1	0	0
Access	R/W	-	R/W	RO	R/W	R/W	R/W	WO

**UART\_GIE:** UART Global Interrupt 15 Enable

0 = UART Global I Interrupt disable

1 = UART Global I Interrupt enable

**UTRXNB:** The ninth bit data of receiver buffer

**RX\_BYTE\_HIGH :** receive data high byte(only for DMA)

0 = waiting receive data low byte

1 = waiting receive data high byte

**RXIF:** UART RX Interrupt Flag

0 = Normal Receive or AUTO DMA mode Receive one word not done

1 = Normal Receive or AUTO DMA mode Receive one word done

In normal mode , ,it become “1” every byte, but in DMA mode ,it become “1” every word.

**TXIF:** UART TX Interrupt Flag

0 = UART transmit not done

1 = UART transmit done

Writing data to UTBUF or Writing UARTDMATXCNT will clear this flag.

**OVERFLOWIF:** UART overflow Interrupt Flag

0 = UART overflow not done

1 = UART overflow done

**RXKICK:** UART DMA receive KICK start

0 = not KICK start

1 = KICK start

Register 8-9 UART1DIV – UART1 divide register

Position	7	6	5	4	3	2	1	0
Name	UART1DIV							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 8-10 UART1BAUD – UART1 Baud Rate register

Position	7	6	5	4	3	2	1	0
Name	UART1BAUD							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Baud Rate =Fsys clock / [(UARTDIV+1) ( UART1BAUD + 1))

Register 8-11 UART1DATA – UART1 Data

Position	7	6	5	4	3	2	1	0
Name	UART1DATA							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Write this location will load the data to transmitter buffer. And read this location will read the data from the receiver buffer.

Register 8-12 UARTDMATXCNT –UART1 DMA Transmit counter

Portion	7	6	5	4	3	2	1	0
Name	UARTDMATXCNT							
Default	x	x	x	x	x	x	X	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Nbyte = UARTDMATXCNT + 1

Register 8-13 UARTDMATXPTR–UART1 DMA Transmit Start Pointer byte

Portion	7	6	5	4	3	2	1	0
Name	UARTDMATXPTR							
Default	x	x	x	X	x	x	X	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

In order to get the correct DMA Start Pointer , you should write this register twice. First write the higher byte, then the low byte. DMA address only map to SRAM1.

Register 8-14 UARTDMARXPTR–UART1 DMA receive Start Pointer byte

Portion	7	6	5	4	3	2	1	0
Name	UARTDMARXPTR							
Default	x	x	x	X	x	x	X	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

In order to get the correct DMA Start Pointer , you should write this register twice. First write the higher byte, then the low byte. DMA address only map to SRAM1.

Register 8-15 UART1MINUS–UART1 DMA receive data minus byte count by CPU

Portion	7	6	5	4	3	2	1	0
Name	UART1MINUS							
Default	x	x	x	X	x	x	X	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Nbyte = UART1MINUS+ 1'b1

Register 8-16 UART1POINTL–UART1 DMA point by CPU read

Portion	7	6	5	4	3	2	1	0
Name	UART1POINTL							
Default	x	x	x	X	x	x	X	x
Access	R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O

Register 8-17 UART1POINTH–UART DMA point by CPU read high byte

Portion	7	6	5	4	3	2	1	0
Name	UART1POINTH							
Default	x	x	x	X	x	x	X	x
Access	R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O

Register 8-18 UART1LOOPCNT–UART1 DMA loop count

Position	7	6	5	4	3	2	1	0
Name				overflowcnt		dma_loop_cnt		
Default				0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

**overflowcnt:** less than bytes UART receive data ram size

00 = 4 bytes

01 = 8 bytes

10 = 16 bytes

11 = 32 bytes

**dma\_loop\_cnt::**UART receive data ram size

000 = 16 bytes

001 = 32 bytes

010 = 64 bytes

011 = 128 bytes

100 = 256 bytes

101 = 512 bytes

110 = 1K bytes

111 = forbidden

Register 8-19 UART1CNTH–UART1 DMA receive count high byte

Portion	7	6	5	4	3	2	1	0
Name	UART1CNTH							
Default	x	x	x	X	x	x	X	x
Access	R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O

Register 8-20 UART1CNTL–UART1 DMA receive count low byte

Portion	7	6	5	4	3	2	1	0
Name	UART1CNTL							
Default	x	x	x	x	x	x	x	x
Access	R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O

## 8.3 Operation Guide

### 1) UART1 Normal mode Operation Flow:

1. Set IO in the correct direction.
2. Configure UARTDIV and UART1BAUD to choose sample rate and baud.
3. Enable UART1 module by setting UTEN to '1'
4. Set TXIE or RXIE 'to 1' if needed
5. write data to UART1DATA
6. Wait for PND to change to '1', or wait for interrupt
7. Read received data from UART1DATA if needed
8. Go to Step 5 to start another process if needed or turn off UART1 by UTEN.

**2) UART1 DMA Mode Operation Flow:**

1. Set IO in the correct direction.
2. Configure UARTDIV and UART1BAUD to choose sample rate and baud.
3. Configure UART1CON Select DMA.
4. Write the start DMA address. for receive, Write data to UARTDMARXPTR
5. Enable UART module by setting UTEN to '1'.
6. kick-start a DMA receive process
7. Wait overflow or delay some time ,read UART1CNTH and UART1CNTL,read data by write UART1MINUS (UART1MINUS<{UART1CNTH,UART1CNTL}).
8. Write the start DMA address. for transmission, Write data to UARTDMATXPTR
9. Write data to UARTDMATXCNT to kick-start a DMA transmit process
10. Wait for PND to change to '1', or wait for interrupt

## 8.4 BT Control Register

Register 8-21 BTCON1 – BT control register1

Position	7	6	5	4	3	2	1	0
Name			BTC2RS	BTCDCLKO	BTCDCLKI	BTRSTB	Reserved	XOSC26MEN
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	RO	R/W	R/W	R/W	R/W

**BTC2RS:** BTCON2 read select

0: read BTCONT register

1: read BT output state

**BTCDCLKO:** BT CDCLK output state

**BTCDCLKI:** BT CDCLK input state

**XOSC26MEN:** BT xosc26M enable

0 = disable

1 = enable

Register 8-22 BTCON2 – BT control register2

Position	7	6	5	4	3	2	1	0
Name	BTTX	BTRX	BTCTS	Reserved	BTGPIO10	BTGPIO9	BTGPIO5	BTGPIO4
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**write:** write data to BT

**read:** depend on BTCON1[5]

# 9 IR receiver

CW6686D provides digital IR receiver, it can receiver IR data then CPU can read IR data from IR data buffer.

## 9.1 IR frame format

Figure 9-1 shows the IR data frame format

Figure 9-1 IR data frame format

Figure 9-2 shows the IR repeat frame format

Figure 9-2 IR repeat frame format

Figure 9-3 shows the IR bit 0 and bit 1 format

Figure 9-3 IR bit frame format

## 9.2 IR Receiver Control Registers

Register 9-1 IRCON0 - IR receiver control 0 register

Position	7	6	5	4	3	2	1	0
Name	-	-	-	IRPINSEL	IRREPEAT	IRPND	IRIE	IREN
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	R/W	RO	R/W	R/W	R/W

**IRPINSEL:** IR input pin select

0 = P07 as IR receiver input

1 = P33 as IR receiver input

**IRREPEAT:** IR receiver repeating data

0 = Not repeat

1 = Repeat

**IRPND:** IR receiver done

0 = Undone

1 = Done

**IRIE:** IR interrupt enable

0 = Disabled

1 = Enabled

**IREN:** IR enable

0 = Disabled

1 = Enabled

Register 9-2 IRCON1 - IR receiver control 1 register

Position	7	6	5	4	3	2	1	0
Name	IRCON1							
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

The IRCON1 is the entrance for five 8-bit control registers: ONEFULL, ZEROCYC, REPEATCNT, ENDCONT and BEGINCNT. And IRCON1 must be written five times to update all the five control registers.

First time for the **ONEFULL**.

Position	7	6	5	4	3	2	1	0
Name	ONEFULL							
Default	1	0	0	1	1	1	0	0

When IR clock is 1 MHz,  $\text{ONEFULL} \times 16 \times \text{CLKCYC}$  us is the time of IRDATA error. It is recommended to set ONEFULL to 0x9C. (**NOTE:**  $\text{ONEFULL} \times 16 > \text{BIT 1 cycle}$ ),

When IR clock is 32 KHz,  $\text{ONEFULL} \times \text{CLKCYC}$  us is the time of IRDATA error. It is recommended to set ONEFULL to 0x5E (**NOTE:**  $\text{ONEFULL} \times 8 > \text{BIT 1 cycle}$ )

Second time for the **ZEROCYC**.

Position	7	6	5	4	3	2	1	0
Name	ZEROCYC							
Default	0	1	0	1	0	0	0	0

When IR clock is 1 MHz,  $ZEROCYC \times 16 \times CLKCYC$  us is the cycle of IR BIT 0 and BIT 1 division. It is recommended to set ZEROCYC to 0x50. (**NOTE:** BIT 0 cycle < ZEROCYC\*8 < BIT 1 cycle )

When IR clock is 32 KHz,  $ZEROCYC \times CLKCYC$  us is the cycle of IR BIT 0 and BIT 1 division. It is recommended to set ZEROCYC to 0x28 (**NOTE:** BIT 0 cycle < ZEROCYC < BIT 1 cycle)

Third time for the **REPEATCNT**.

Position	7	6	5	4	3	2	1	0
Name	REPEATCNT							
Default	0	0	0	0	0	1	0	0

When IR clock is 1 MHz,  $REPEATCNT \times 512 \times CLKCYC$  us is the IR repeat pulse (2.3ms). It is recommended to set REPEATCNT to 0x04.

When IR clock is 32 KHz,  $REPEATCNT \times 32 \times CLKCYC$  us is the IR repeat pulse (2.3ms). It is recommended to set REPEATCNT to 0x02.

Fourth time for the **ENDCNT**.

Position	7	6	5	4	3	2	1	0
Name	ENDCNT							
Default	1	0	0	0	0	0	0	0

When IR clock is 1 MHz,  $ENDCNT \times 512 \times CLKCYC$  us is the IR incept high (4ms). It is recommended to set ENDCNT to 0x08.

When IR clock is 32 KHz,  $ENDCNT \times 32 \times CLKCYC$  us is the IR incept high (4ms). It is recommended to set ENDCNT to 0x09.

Fifth time for the **BEGINCNT**.

Position	7	6	5	4	3	2	1	0
Name	BEGINCNT							
Default	0	0	0	1	0	0	0	1

When IR clock is 1 MHz,  $BEGINCNT \times 512 \times CLKCYC$  us is the IR incept low (9ms). It is recommended to set BEGINCNT to 0x11.

When IR clock is 32 KHz,  $BEGINCNT \times 32 \times CLKCYC$  us is the IR incept low (9ms). It is recommended to set BEGINCNT to 0x08.

**NOTE:** When IR clock is 1 MHz and BEGINCNT or ENDCNT or REPEATCNT is configured to N, the detect range is  $N \times 512 \times \text{cycle} \sim (N \times 512 + 511) \times \text{cycle}$ .

**NOTE:** when IR clock is 32 KHz and BEGINCNT or ENDCNT or REPEATCNT is configured to N, the detect range is  $N \times 32 \times \text{cycle} \sim (N \times 32 + 31) \times \text{cycle}$

Register 9-3 IRDAT0 - IR receiver data buffer0 register

Position	7	6	5	4	3	2	1	0
Name	IRDAT0							
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	RO	RO	RO	RO	RO

Register 9-4 IRDAT1 - IR receiver data buffer1 register

Position	7	6	5	4	3	2	1	0
Name	IRDAT1							
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	RO	RO	RO	RO	RO

Register 9-5 IRDAT2 - IR receiver data buffer2 register

Position	7	6	5	4	3	2	1	0
Name	IRDAT2							
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	RO	RO	RO	RO	RO

Register 9-6 IRDAT3 - IR receiver data buffer3 register

Position	7	6	5	4	3	2	1	0
Name	IRDAT3							
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	RO	RO	RO	RO	RO

## 9.3 IR Receiver Operation Guide

- 1) Configure IR clock (CLKCON2);
- 2) Configure IRCON1 if needed;
- 3) Configure IRCON0;
- 4) Wait IRPND or IR interrupt;
- 5) Read IRDAT0/1/2/3.

# SPI

## 10.1 SPI0

SPI0 can serve as master or slave. It can operate in normal or DMA mode.

SPI0 map to three group ports configured by PWKEDGE[6] and SPICON[3]:

Group0 - P27, P25, P26;

Group1 - P04, P06, P05;

Group2 - P14, P00, P34.

Group3 - P30(P40), P31, P32

When PWKEDGE[6]=0 and SPI0CON.3 = 0, Group0 actived

- 2wire mode: P2.6 as SPI0CLK0, P2.7 as SPI0DIDO0;
- 3wire mode: P2.6 as SPI0CLK0, P2.7 as SPI0DO2, P2.5 as SPI0DI0.

When PWKEDGE[6]=0 and SPI0CON.3 = 1, Group1 actived

- 2wire mode: P0.5 as SPI0CLK1, P0.4 as SPI0DIDO1;
- 3wire mode: P0.5 as SPI0CLK1, P0.4 as SPI0DO1, P0.6 as SPI0DI1.

When PWKEDGE[6]=1 and SPI0CON.3 = 0 Group2 actived

- 2wire mode: P3.4 as SPI0CLK2, P1.4 as SPI0DIDO2;
- 3wire mode: P3.4 as SPI0CLK2, P1.4 as SPI0DO2, P0.0 as SPI0DI2.

When PWKEDGE[6]=1 and SPI0CON.3 = 1, Grop3 actived

- 2wire mode: P3.0 as SPI0CLK3, P3.2 as SPI0DIDO3;
- 3wire mode: P3.0 as SPI0CLK3, P3.2 as SPI0DO3, P3.1 as SPI0DI3.
- when PMUXCON0[5] = 1 P4.0 as SPI0CLK3

Figure 10-1 SPI timing

## 10.1.1 SPI0 Special Function Registers

Register 10-1 SPI0CON – SPI0 control

Position	7	6	5	4	3	2	1	0
Name	SPI0PND	SPI0SM	SPI0RT	SPI0WS	SPI0PS0	SPI0EDGE	SPI0IDST	SPI0EN
Default	1	0	0	0	0	0	0	0
Access	RO	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**SPI0PND:** SPI0 Pending bit (read only, writing SPI0BUF will clear this bit)

0 = Transmission is not finish

1 = Transmission finish

**SPI0SM:** SPI0 mode selection

0 = Master mode

1 = Slave mode

**SPI0RT:** SPI0 RX/TX select bit in 2-wire mode or DMA mode

0 = TX

1 = RX

In 3-wire mode, SPI0 can both Transmit and receive at the same time. But when using DMA mode or 2-wire mode, just one direction (TX or RX) is allowed. Use this bit to select TX or RX.

**SPI0WS:** SPI0 2-wire mode/3-wire mode select bit

0 = 3-wire mode

1 = 2-wire mode

**SPI0PS0:** SPI0 Port select 0

0 = Select P27, P25, P26 when SPI0PS1 = 0; Select P14, P00, P34 when SPI0PS1 = 1

1 = Select P04, P06, P05 when SPI0PS1 = 0

**SPI0EDGE:** SPI0 sampling edge select bit

When SPI0IDST = 0:

0 = Sample at falling edge

1 = Sample at rising edge

When SPI0IDST = 1:

0 = Sample at rising edge

1 = Sample at falling edge

**SPI0IDST:** SPI0 clock signal idle state

0 = Clock signal stay at 0 when idle

1 = Clock signal stay at 1 when idle

**SPI0EN:** SPI0 enable bit

0 = SPI0 disable

1 = SPI0 enable

Register 10-2 SPIBAUD – SPI0 Baud Rate

Position	7	6	5	4	3	2	1	0
Name	SPIBAUD							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Baud rate =  $F_{\text{system\_clock}} / [2(\text{SPIBAUD}+1)]$

Register 10-3 SPI0BUF – SPI0 Data Buffer

Position	7	6	5	4	3	2	1	0
Name	SPI0BUF							
Default	x	x	x	x	x	x	x	X
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 10-4 SPIDMACNT – SPI0 DMA counter

Position	7	6	5	4	3	2	1	0
Name	SPIDMACNT							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Nunit = SPIDMACNT + 1

Nbyte = Nunit \* 2 = (SPIDMACNT + 1) \* 2

Register 10-5 SPIDMAPTRH– SPI0 DMA Start Pointer high byte

Position	7	6	5	4	3	2	1	0
Name	SPIDMAPTRH							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Register 10-6 SPIDMAPTRL– SPI0 DMA Start Pointer low byte

Position	7	6	5	4	3	2	1	0
Name	SPIDMAPTRL							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

## 10.1.2 SPI0 Operation Guide

When SPI0CON1.1=0,

### SPI0 Normal Mode Operation Flow:

1. Set IO in the correct direction.
2. Select SPI0RT in 2-wire mode if 2-wire mode is selected
3. Select master mode or slave mode
4. Configure clock frequency when master mode is selected in step 3
5. Select one of the four timing mode (refer to *Figure 10-1*)

6. Enable SPI0 module by setting SPI0EN '1'
7. Set SPI0IE '1' if needed
8. Write data to SPI0BUF to kick-start the process
9. Wait for SPI0PND to change to '1', or wait for interrupt
10. Read received data from SPI0BUF if needed
11. Go to Step 8 to start another process if needed or turn off SPI0 by clearing SPI0IE and SPI0EN

**SPI0 DMA Mode Operation Flow:**

1. Set IO in the correct direction.
2. Select SPI0RT for DMA direction
3. Select master mode or slave mode
4. Configure clock frequency when master mode is selected in step 3
5. Select one of the four timing modes (refer to *Figure 10-1*)
6. Enable SPI0 module by setting SPI0EN to '1'
7. Set SPI0IE '1' if needed
8. Write the start address to SPI0DMASP
9. Write data to SPI0DMACNT to kick-start a DMA process
10. Wait for SPI0PND to change to '1', or wait for interrupt
11. Go to Step 8 to start another DMA process if needed or turn off SPI0 by clearing SPI0IE and SPI0EN

## 10.2 SPI1

CW6686D SPI1 is an accelerated SPI. It can serve as master only. It can operate in normal or DMA mode. Please see PMUXCON0 bit 5 descriptions

**SPI1 uses 2 pins for 2 wire mode:**

- Serial Data (SPIDIDO1) - P04
- Serial Clock (SPICLK1) - P05

**SPI1 uses 3 pins for 3 wire mode:**

When SPI1\_MAP = 0,

- Serial Data Out (SPIDO1) - P04
- Serial Data In (SPIDI1) - P06
- Serial Clock (SPICLK1) - P05

When SPI1\_MAP = 1,

- Serial Data Out (SPIDO0) - P04
- Serial Data In (SPIDI0) - P42
- Serial Clock (SPICLK0) - 05

## 10.2.1 SPI1 Special Function Registers

Register 10–7 SPI1CON – SPI1 Configure Register

Position	7	6	5	4	3	2	1	0
Name	SPI1PND	DMAERR	SPI1RT	SPI1WS	SPI1DEC	-		SPI1EN
Default	1	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	RO	RO	R/W

**SPI1PND:** SPI1 Pending bit (read only, writing SPI1BUF will clear this bit)

0 = Transmission has not finished

1 = Transmission finish

**DMAERR:** SPI1 DMA Error flag

0 = No DMA error

1 = DMA error happened.

**SPI1RT:** SPI1 RX/TX select bit in 2-wire or DMA mode

0 = TX

1 = RX

In 3-wire mode, SPI1 can both Transmit and receive at the same time. But if we use DMA mode or 2-wire mode, just one direction (TX or RX) is allowed. Use this bit to select TX or RX.

**SPI1WS:** SPI1 2-wire mode/3-wire mode select bit

0 = 3-wire mode

1 = 2-wire mode

**SPI1DEC:** SPI1 decryption function enables

0 = Disabled

1 = Enabled

**SPI1EN:** SPI1 enable bit

0 = SPI1 disabled

1 = SPI1 enabled

Register 10–8 SPI1CON1 – SPI1 Configure Register1

Position	7	6	5	4	3	2	1	0
Name	-	-	-	-	-	-	CRCEN	ENCRYPT
Default	-	-	-	-	-	-	0	0
Access	-	-	-	-	-	-	R/W	R/W

**CRCEN:** SPI1 CRC enable when SPI1 receiving data

0 = Disabled

1 = Enabled

**ENCRYPT:** SPI1 output encryption function enable

0 = Disabled

1 = Enabled

**NOTE:** *ENCRYPT and SPI1DEC cannot be 1 at the same time.*

Register 10–9 SPI1BUF – SPI1 Data Buffer

Position	7	6	5	4	3	2	1	0
Name	SPI1BUF							
Default	X	x	x	x	x	x	x	X
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Write this location to load the data to transmitter buffer and kick start the SPI transmission, read this location will read the data from the receiver buffer.

Register 10–10 SPI1DMASPH– SPI1 DMA Pointer

Position	7	6	5	4	3	2	1	0
Name	-	-	SPI1DMASPH					
Default	0	0	x	x	x	x	x	x
Access	-	-	WO	WO	WO	WO	WO	WO

SPI DMA start address pointer, point to the start address in IRAM that the data to be transmitted or data to be stored.

Register 10–11 SPI1DMASPL– SPI1 DMA Pointer

Position	7	6	5	4	3	2	1	0
Name	SPI1DMASPL							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Register 10–12 SPI1DMACNTH – SPI1 DMA Counter High byte

Position	7	6	5	4	3	2	1	0
Name						SPI1DMACNTH		
Default	X	X	x	X	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Register 10–13 SPI1DMACNTL – SPI1 DMA Counter Low Byte

Position	7	6	5	4	3	2	1	0
Name	SPI1DMACNTL							
Default	X	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

SPI DMA counter, decide the amount of units to be transmitted or received. There is 2 bytes in a unit. DMA counter is range from 0 to 2047 words. And there is a formula as follow:

$$\text{SPIDMACNT} = \{\text{SPIDMACNTH}, \text{SPIDMACNTL}\}$$

$$\text{Nunit} = \text{SPIDMACNT} + 1$$

$$\text{Nbyte} = \text{Nunit} * 2 = (\text{SPIDMACNT} + 1) * 2$$

Write this location will enable DMA and kick start a DMA process .Caution: do not write 0 to this register.

**Note:** Must write SPIDMACNTH, then write SPIDMACNTL, this order can't change !!!

Register 10–14 SPI1BAUD – SPI1 BAUD RATE

Position	7	6	5	4	3	2	1	0
----------	---	---	---	---	---	---	---	---

Name	SPI1BAUD							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

SPI Baud Rate, from 0 to 255

SPI Clock is System Clock / (SPI1BAUD + 1) , If SPI1BAUD is 0, then SPI Clock is same as System Clock.

## 10.2.2 SPI1 Operation Guide

### A. SPI Normal Mode Operation Flow:

1. Set IO in the correct direction.
2. Select SPI1WS in 2-wire mode or 3 wire mode.
3. Select SPI1RT for reception or transmission.
4. Configure clock frequency using bit SPI1SP.
5. Enable SPI module by setting SPI1EN '1'
6. Set SPI1IE '1' if needed
7. Write data to SPI1BUF to kick-start the process
8. Wait for SPI1PND change to '1', or wait for interrupt
9. Read received data from SPI1BUF if needed
10. Go to Step 7 to start another process if needed or turn off SPI1 by clearing SPI1PND and SPI1EN

### B. SPI DMA Mode Operation Flow:

1. Set IO in the correct direction.
2. Select SPI1RT for DMA direction
3. Select SPI1WS in 2-wire mode or 3 wire mode
4. Configure clock frequency using bit SPI1SP
5. Enable SPI module by setting SPI1EN '1'
6. Set SPI1IE '1' if needed
7. Write the start address to SPI1DMASP
8. Write data to SPI1DMACNT to kick-start the DMA process.
9. Wait for bit SPI1PND to change to '1', or wait for interrupt
10. Go to Step 7 to start another DMA process if needed or turn off SPI by clearing SPI1PND and SPI1EN

# 11 External Memory Interface (EMI)

CW6686D provides External Memory Interface (EMI) to accelerate data transfer. [Figure 11-1](#) shows EMI timing.

Figure 11-1 EMI timing

## 11.1 EMI Control Registers

Register 11-1 EMICON0 – EMI control0

Position	7	6	5	4	3	2	1	0
Name	EMIEN	EMIPW			EMIHT		EMIST	
Default	1	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

### EMIEN:

When writing: EMI Enable

0 = Disable

1 = Enable

### EMIPW: EMI pulse width

000 = 1 system clock cycle

001 = 2 system clock cycles

010 = 3 system clock cycles

011 = 4 system clock cycles

100 = 5 system clock cycles

101 = 6 system clock cycles

110 = 7 system clock cycles

111 = 8 system clock cycles

### EMIHT: EMI hold time

00 = 1 system clock cycle

01 = 2 system clock cycles

10 = 3 system clock cycles

11 = 4 system clock cycles

**EMIST:** EMI setup time

00 = 1 system clock cycle

01 = 2 system clock cycles

10 = 3 system clock cycles

11 = 4 system clock cycles

Register 11-2 EMICON1 – EMI control1

Position	7	6	5	4	3	2	1	0
Name	EMIPND	CLKSEL	OUTSEL	PWMEN	EMIDMAB		EMIDMAM	EMIM
Default	1	0	0	0	0	0	0	0
Access	RO	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**EMIPND:** When Read EMI done flag

0 = EMI is transmitting data

1 = EMI is IDLE

When Write “0”, clear write buffer counter; write “1” affect another

**CLKSEL:** PWM module work clock select

0 = 24MHz

1 = 48MHz

**OUTSEL:** PWM output select

0 = LED anode display

1 = LED cathode display

**PWMEN:** PWM enable

0 = Disable

1 = Enable

**EMIDMAB:** EMI DMA converts byte select

00 = reserved

01 = 1 byte

10 = 2 byte

11 = 3 byte

**EMIDMAM:** EMI DMA mode

0 = no convert

1 = bit convert to byte

**EMIM:** EMI mode

0 = work when CPU kick start

1 = work with SPI1 DMA

Register 11-3 EMIBUF – EMI output buffer

Position	7	6	5	4	3	2	1	0
Name	EMIBUF							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

EMIBUF is the entrance of 6 bytes EMI output buffer. The 6 bytes EMI output buffer is emibuf0, emibuf1, emibuf2, emibuf3, emibuf4 and emibuf5. When CPU writes to EMIBUF, internal counter will add "1", CPU data is pushed corresponding buffer. You should clear internal counter by writing "0" to emicon1 bit 7;

PWM mode: should write eight times for eight channels PWM of P2

When EMIM = 0, emibuf0 will output to P2. Emibuf0 is updated with CPU write data.

When EMIM = 1 and in no convert mode, emibuf0 will output to P2. Emibuf0 is updated with SPI1 DMA data.

When SPI2EMI = 1 and in convert mode, there are 3 output modes:

Corresponding bit	0			1		
1 byte mode	emibuf0			emibuf3		
2 byte mode	emibuf0		emibuf1	emibuf3		emibuf4
3 byte mode	emibuf0	emibuf1	emibuf2	emibuf3	emibuf4	emibuf5

When EMIM = 0 and EMIEN = 1, EMI transfer will be started by writing to EMIBUF.

When EMIM = 1 and EMIEN = 1, EMI transfer will be started by SPI DMA.

#### PWM Operation Guide

1. Configure EMICON1 register;
2. Read data from FFT output buffer;
3. Write data to PWMDAT register.

## 12 SD Card Host Controller (SDC)

### 12.1 Features

The CW6686D SD card host controller can support SD/MMC card devices.

- SD memory Card Spec (Ver2.0) / MMC Spec (Ver4.3) compatible;
- CRC7 and CRC16 Generator;
- Support Interrupt and DMA Data transfer mode;
- Support 1-bit or 4-bit data bus width;

### 12.2 IO Mapping

Table 12-1 shows the SDC IO Mapping

Table 12-1 IO mapping

BUS signals	Port group 0	Port group 1
SDCLK	SDCLK0 - P21	SDCLK0 - P3.0
SDCMD	SDCMD0 - P20	SDCMD0 - P3.1
SDDAT0	SDDAT00 - P27	SDDAT00 - P3.2
SDDAT1	/	SDDAT1 - P0.0
SDDAT2	/	SDDAT2 - P0.1
SDDAT3	/	SDDAT3 - P1.4

### 12.3 SDC Special Function Registers

Register 12-1 SDCON0 – SD host control register 0

Position	7	6	5	4	3	2	1	0
Name	CKST			DKST		DW4	SDCKE	SDE
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	R/W	R/W	R/W

**CKST:** Command operation kicks start bits

000 = No operation

001 = Send command; receive 6-byte response, without check busy

011 = Send command; receive 17-byte response, without check busy

101 = Send command; receive 6-byte response, with check busy

111 = Send command; receive 17-byte response, with check busy

010 = Send command, without receive response, without check busy

100 = Send command, without receive response, with check busy

Others = Reserved

**DKST:** Data operation kicks start bits

00 = No operation

01 = Receive data

10 = Send data, without check busy

11 = Send data, with check busy

**DW4:** Data bus width

0 = 1-bit mode

1 = 4-bit mode

**SDCKE:** SD clock out when no command/data is sending

0 = Disable

1 = Keep clocking out

**SDE:** SD host controller enable bit

0 = Disabled

1 = Enabled

Register 12-2 SDCON1 – SD host control register 1

Position	7	6	5	4	3	2	1	0
Name	CIE	DIE	CPND	DPND	CPCLR	DPCLR	8CKE	ORISE
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	RO	RO	WO	WO	R/W	R/W

**CIE:** Command interrupt enable bit

0 = Disable

1 = Enable

**DIE:** Data interrupt enable bit

0 = Disable

1 = Enable

**CPND:** Command interrupts pending flag

0 = Inactive

1 = Interrupt pending

**DPND:** Data interrupt pending flag

0 = Inactive

1 = Interrupt pending

**CPCLR:** Command interrupts pending clear bit

0 = Inactive

1 = Clear pending

**DPCLR:** Data interrupt pending clear bit

0 = Inactive

1 = Clear pending

**8CKE:** Send eight SD clocks after command or data

0 = Disable

1 = Enable

**ORISE:** Edge selection for sending data and command

0 = Falling

1 = Rising

Register 12-3 SDCON2 – SD host control register 2

Position	7	6	5	4	3	2	1	0
Name	RCRCE	DCRCE	NRPS	BUSY	SDEC	CRCS		
Default	x	x	0	x	0	x	x	x
Access	RO	RO	RO	RO	R/W	RO	RO	RO

**RCRCE:** Response packet CRC error flag

Update when the response CRC is receiving, so it is invalid if kick start command by 010/100 and it is only valid in R1 or R1b, software should ignore this bit in R2/R3/R6/R7.

0 = Inactive

1 = Error detected

**DCRCE:** Data packet CRC error flag

Update when the data CRC is receiving, so it is only valid after operation “read data” is done.

0 = Enactive

1 = Error detected

**NRPS:** No response received

When command is kick start by ‘001/011/101/111’ this bit indicate that response timeout (no response is received in 256 SD clocks after command).

0 = Response received

1 = No response received

**BUSY:** Busy flag. The logic level of pad DAT0

0 = Busy

1 = Free

**SDEC:** SD decryption enables

0 = Disable

1 = Enable

**CRCS:** CRC status of the sent data packet

Update when the CRC status is receiving, so it is only valid after operation “write data” is done.

101 = Error transmission

010 = Non-erroneous transmission

111 = Flash error

Register 12-4 SDBAUD – SD host baud rate

Position	7	6	5	4	3	2	1	0
Name	SDBAUD							
Default	0	0	0	0	0	0	0	0

Access	WO	WO	WO	WO	WO	WO	WO	WO
--------	----	----	----	----	----	----	----	----

**SDBAUD:** Baud rate control

Baud rate = system clock / 2\*(SDBAUD +1)

Register 12-5 SDCPTR – SD host Command DMA address

Position	7	6	5	4	3	2	1	0
Name	CPTR							
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

Register 12-6 SDDPTR – SD host Data DMA address

Position	7	6	5	4	3	2	1	0
Name	DPTR							
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

Register 12-7 SDDCNT – SD host Data Counter

Position	7	6	5	4	3	2	1	0
Name	DCNT							
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

In order to get the correct DATA DMA counter, you should write this register twice. First write the higher byte, then the low byte. The range is: 0x00~0x1ff.

Total number of bytes received / transferred is (DCNT + 1) x 2

## 12.4 SDC Operation Guide

### 12.4.1 Command Operation

When command is kick-started (by writing one of the following kick-start command to SDCFG[7: 5]), SD module sends out the pre-set command. After command has been sent, it will kick-start in one of the following options:

001 = Wait for 6-byte response. CPND is set to '1' by hardware after response is received.

011 = Wait for 17-byte response. CPND is set to '1' by hardware after response is received.

101 = Wait for 6-byte response. After response is received and DAT0 is '1', CPND is set to '1' by hardware.

111 = Wait for 17-byte response. After response is received and DAT0 is '1', CPND is set to '1' by hardware.

010 = Do not wait for response and set CPND to '1' by hardware immediately.

100 = Do not wait for response, if DAT0 is '1', set CPND to '1' by hardware immediately.

CPND (SDCFG [13]) will be set to 1 by hardware and it indicates that command and response operations are complete. At this moment, if RCRCE (SDCFG2 [7]) is set to 1, the received response has CRC error. The previous command should be resent.

Note: RCRCE bit is valid only when receiving R1 or R1b response. RCRCE bit can be ignored for other types of

response.

**Operation Flow:**

1. Configure 8CE (SDCFG1 [1]) and ORISE (SDCFG1 [0]).
2. Write the outgoing command to IRAM and set SDCPTR to point to starting address of command.
3. Choose the kick-start command method according to response required.
4. Wait for CPND (SDCFG1 [5]) to become '1' or wait for interrupt.
5. If the expected response is R1 or R1b, read CCRCE (SDCFG2 [7]) to determine if CRC is valid.
6. Read content of response from IRAM.

## 12.4.2 Data Operation

**Sending data:**

1. Configure DW4 (SDCFG0 [2]), 8CE (SDCFG1 [1]) and ORISE (SDCFG1 [0]).
2. Write outgoing data to IRAM and set SDDPTR to point to starting address of data.
3. Configure SDDCNT to the amount of outgoing data.
4. Kick-start data sending process.
5. Wait for DPND (SDCFG1 [4]) to become '1' or wait for interrupt.
6. Read CRCS (SDCFG2 [2:0]) to obtain CRC status value from SD device.

**Receiving data:**

1. Configure DW4 (SDCFG0 [2]), 8CE (SDCFG1 [1]) and ORISE (SDCFG1 [0]).
2. Set SDDPTR to point to starting address of data being stored.
3. Configure SDDCNT to the amount of incoming data.
4. Kick-start data receiving process.
5. Wait for DPND (SDCFG1 [4]) to become '1' or wait for interrupt.
6. Read DCRCE (SDCFG2 [6]) to determine if the data received has any error.
7. Read the data received from IRAM.

# 13 Audio Terminal (DAC)

## 13.1 Features

CW6686D provides 16-bit resolution audio DAC:

- Sample Rate 8 / 11.025 / 12 / 16 / 22.05 / 24 / 32 / 44.1 / 48KHz
- Low Clock Jitter Sensitivity
- Soft Mute and -48Db Attenuator
- Class AB headphone amplifier
- 32 Level analog Gain/attenuation from dB to dB

## 13.2 DAC Special Function Registers

There are 2 SFR to support DAC registers read/write function:

Register 13-1 ATADR - audio terminal address

Position	7	6	5	4	3	2	1	0
Name	DONE	DIR	ATADR					
Default	x	x	x	x	x	x	x	x
Access	RW	RW	RW	RW	RW	RW	RW	RW

**DONE:** read/write operation done flag

0 = read/write operation is done

1 =read/write operation is running

**DIR:** read/write direction select

0 =read register

1 = write register

**ATADR:** Address of DAC registers

Register 13-2 ATDAT - audio terminal data

Position	7	6	5	4	3	2	1	0
Name	ATDAT							
Default	x	x	x	x	x	x	x	x
Access	RW	RW	RW	RW	RW	RW	RW	RW

ATDAT:

After read operation, CPU read this register to get the data.

Before write operation, CPU writes data to this register.

### 13.2.1 DAC Register Mapping

Table 13-1 DAC registers address mapping:

Name	Address	Descriptions
DACCFG	0	DAC configuration register
DACSM	1	DAC soft mute configuration register
DACSPR	2	DAC sample rate register
DACVOLL	3	DAC volume setting low byte register
DACVOLH	4	DAC volume setting high byte register
DACVCON	5	DAC volume control register
TRIMCON1	6	DAC trim control register1
TRIMCON2	7	DAC trim control register2
TRREGLL	8	DAC left channel trim data register low byte
TRREGLH	9	DAC left channel trim data register high byte
TRREGRL	10	DAC right channel trim data register low byte
TRREGRH	11	DAC right channel trim data register high byte
EQCON1	12	EQ configuration register1
EQCOF	13	EQ coefficient FIFO
EQCON2	14	EQ configuration register2
EQVOLIN	15	EQ data input volume configuration register
DACLRMIX0	16	DAC L & R channel mixing coefficient 0
DACLRMIX1	17	DAC L & R channel mixing coefficient 1
DACLRMIX2	18	DAC L & R channel mixing coefficient 2
DACLRMIX3	19	DAC L & R channel mixing coefficient 3

### 13.2.2 Function of DAC Control Registers

Register 13-3 DACCFG - DAC configuration register

Position	7	6	5	4	3	2	1	0
Name	-	-	-		DIT_SEL	MIX_EN	OSSL	DACEN
Default	-	-	-			0	0	0
Access	-	-	-			RW	RW	RW

**DIT\_SEL:** sdm dither signal select

0 = sine wave

1 = white noise

**MIX\_EN:** DAC MIX enable

0 = Disabled

1 = Enabled

**OSSL:** DAC over sample mode select

0 = Normal speed mode

1 = Double speed mode

**DACEN:** DAC digital filter/delta-sigma modulator enable

0 = Disabled

1 = Enabled

Register 13-4 DACSM - DAC soft mute configuration register

Position	7	6	5	4	3	2	1	0
Name	DACSM							
Default	0	1	1	1	1	1	1	0
Access	RW	RW	RW	RW	RW	RW	RW	RW

DAC soft mute configuration, the reset value of DACSM is 126, user should not change it.

Register 13-5 DACSPR - DAC sample rate register

Position	7	6	5	4	3	2	1	0
Name	-	-	-	-	SRSEL			
Default	-	-	-	-	0	0	0	1
Access	-	-	-	-	RW	RW	RW	RW

**SRSEL:** DAC/FM sample rate select

0000 = 48 KHz

0001 = 44.1 KHz

0010 = 32 KHz

0011 = Reserved

0100 = 24 KHz

0101 = 22.05 KHz

0110 = 16 KHz

0111 = Reserved

1000 = 12 KHz

1001 = 11.025 KHz

1010 = 8 KHz

1011 = Reserved

1100 = 48K synchronized with OBUF (+-0.8% max)

1101 = 44.1K synchronized with OBUF (+-0.8% max)

1110 = 32K synchronized with OBUF (+-0.8% max)

1111 = 16K synchronized with OBUF (+-0.8% max)

1011 = 8K synchronized with OBUF (+-0.8% max)

Register 13-6 DACVOLH - DAC volume setting high byte register

Position	7	6	5	4	3	2	1	0
Name	DACVPND	DACVOLH						
Default	1	1	1	1	1	1	1	1
Access	RW	RW	RW	RW	RW	RW	RW	RW

**DACVPND:** DAC volume adjust done pending

Read "0": not done

Read "1": done

Write “0” clear pending

Write “1” affects nothing

Register 13-7 DACVOLL– DAC volume setting low byte register

Position	7	6	5	4	3	2	1	0
Name	DACVOLL							
Default	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**Note:** When read DACVOLL and DACVOLH, the value isn't the setting value, but the actual DAC volume value

Register 13-8 DACVCON– DAC volume control register

Position	7	6	5	4	3	2	1	0
Name	-	-	-	DACVSET	DACVSTEP	DACVEN	DACVSTEP	
Default	-	-	-	0	0	0	0	0
Access	-	-	-	WO	R/W	R/W	R/W	R/W

**DACVSET:** Direct set DAC volume value

Write “1” to direct set DAC volume value

Write “0” affects nothing

**DACVEN:** DAC volume adjust enable

0 = Disable DAC volume adjust, keep the current volume

1 = Enable DAC volume adjust

{ DACVSTEP2 , **DACVSTEP**}: DAC adjust volume steps

000 = Steps is “1”

001 = Steps is “2”

010 = Steps is “4”

011 = Steps is “8”

100 = Steps is “16”

101 = Steps is “32”

110 = Steps is “64”

111 = Steps is “128”

Register 13-9 TRIMCON1 - DAC trim control register1

Position	7	6	5	4	3	2	1	0
Name	TRIMSPEED		-	-	DITSEL	--	DONESEL	TRIMEN
Default	0	0	-	-	0	0	0	0
Access	RW	RW	-	-	RW	RW	RW	RW

**TRIMSPEED:** DAC trim speed control

00 = trim 1 step every 1 sample

01 = trim 1 step every 2 samples

10 = trim 1 step every 3 samples

11 = trim 1 step every 4 samples

**DITSEL:** DAC trim direction select

0 = Trim direction depend on DAC analog compare out

1 = Trim direction depend on software direction

**DONESEL:** trimming done condition select

0 = Depend on DAC analog compare edge

1 = Depend on match data

**TRIMEN:** DAC trimming enable

0 = Disabled

1 = Enabled

Register 13-10 TRIMCON2 - DAC trim control register2

Position	7	6	5	4	3	2	1	0
Name	-	-	DIRETR	DIRETL	TRIMMTL	TRIMMTR	TMDONE	TRIMKST
Default	-	-	0	0	0	0	0	0
Access	-	-	RW	RW	RW	RW	RW	RW

**DIRETR:** DAC right trim direction

0 = Trim data decrease one step one sample

1 = Trim data add one step one sample

**DIRETL:** DAC left trim direction

0 = Trim data decrease one step one sample

1 = Trim data add one step one sample

**TRIMMTL:** DAC left channel trimming data match

0 = Not match

1 = Match

**TRIMMTR:** DAC right channel trimming data match

0 = Not match

1 = Match

**TMDONE:** DAC trimming done

0 = Not done

1 = Done

**TRIMKST:** DAC trimming kick start

Write 1 to kick start DAC trimming

Register 13-11 TRREGLL - DAC left channel trim data reg law byte

Position	7	6	5	4	3	2	1	0
Name	TRIMREGLL							
Default	-	-	-	-	-	-	-	-
Access	RW	RW	RW	RW	RW	RW	RW	RW

**TRIMREGLL:**

Write: DAC antipant trimming data reg law byte

Read: DAC real trimming data law byte

Register 13-12 TRREGLH - DAC left channel trim data reg high byte

Position	7	6	5	4	3	2	1	0
Name	TRIMREGLH							
Default	-	-	-	-	-	-	-	-
Access	RW	RW	RW	RW	RW	RW	RW	RW

**TRIMREGLL:**

Write: DAC anticipant trimming data register high byte

Read: DAC real trimming data high byte

Register 13-13 TRREGRL - DAC right channel trim data reg law byte

Position	7	6	5	4	3	2	1	0
Name	TRIMREGRL							
Default	-	-	-	-	-	-	-	-
Access	RW	RW	RW	RW	RW	RW	RW	RW

**TRIMREGRL:**

Write: DAC anticipant trimming data register low byte

Read: DAC real trimming data low byte

Register 13-14 TRREGRH - DAC right channel trim data reg high byte

Position	7	6	5	4	3	2	1	0
Name	TRIMREGRH							
Default	-	-	-	-	-	-	-	-
Access	RW	RW	RW	RW	RW	RW	RW	RW

**TRIMREGRH:**

Write: DAC anticipant trimming data register high byte

Read: DAC real trimming data high byte

## 13.3 Operation Guide

### 13.3.1 BDAC Operation Guide

1. Configure DACVOLL & DACVOLH
2. Configure DACVCON
3. Clear DACVPND to kick start adjust volume

# 14 SARADC

## 14.1 Features

CW6686D provides an 11-channel moderate conversion speed and a moderate resolution 10-bit successive approximated register Analog to Digital Converter (SARADC) for users to develop applications in the following areas:

- Voice grade applications
- Audio applications requiring moderate performance
- Measurement requiring moderate performance and speed

SARADC conversion clock must be slower than 1 MHz

## 14.2 ADC Pin Mapping

Table 14-1 pin used

ADC Channel	Function	Description
ADC10	TP3	
ADC9	TP2	
ADC8	P26	Only for PIN detected, Not for ADKEY
ADC7	LDO Band GAP	Reference voltage 0.864V
ADC6	LDO in	1/2 Battery voltage
ADC5	P13	Normal ADC channel
ADC4	P30	Normal ADC channel
ADC3	P22	Normal ADC channel
ADC2	P14	Normal ADC channel
ADC1	P21	Normal ADC channel
ADC0	P33	Normal ADC channel

## 14.3 SARADC Special Function Registers

Register 14-1 ADCCON– SARADC control

Position	7	6	5	4	3	2	1	0
Name	ADCGO	EOC	TMREN	ADCTL	ADCEN	ADCSEL		
Default	0	0	x	x	0	0	0	0
Access	R/W	RO	R/W	R/W	R/W	R/W	R/W	R/W

**ADCGO:** ADC Conversion Start

When read:

0 = Conversion finished

1 = Conversion not finished

When write:

0 = N/A

1 = Start conversion

**EOC**: Check if end of conversion

0 = Finished

1 = Not finished

**TMREN**: Timer Input Enable

0 = Disabled

1 = Enabled

**ADCTL**: Timer Source Select

0 = Timer0

1 = Timer1

**ADCEN**: ADC Module Enable

0 = Disabled

1 = Enabled

**ADCS3, ADCSEL**: ADC Channel Select

0000 = P3.3 (ADC0)

0001 = P2.1 (ADC1)

0010 = P1.4 (ADC2)

0011 = P2.2 (ADC3)

0100 = P3.0 (ADC4)

0101 = P1.3 (ADC5)

0110 = 1/2 Battery voltage

0111 = LDO\_BG. 0.864V

1000 = P26 (ADC8, Only for PIN detected, Not for ADKEY)

1001 = TP2

1010 = TP3

Register 14-2 ADCMODE– SARADC mode control

Position	7	6	5	4	3	2	1	0
Name	-	-	-	ADCS3	AUTOS	ADCSEL_SH		
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	R/W	R/W	R/W	R/W	R/W

**ADCS3**: ADC Channel Select 3

**ADCSEL\_SH**: ADCSEL shadow

**AUTOS**: Auto channel switching mode

0 = Not switch

1 = Auto load ADCSEL\_SH into ADCSEL after conversion finished

Register 14-3 ADCBAUD– SARADC baud rate control

Position	7	6	5	4	3	2	1	0
Name	-	-	ADCBAUD					
Default	-	-	x	x	x	x	x	x
Access	-	-	WO	WO	WO	WO	WO	WO

ADC conversion clock = system clock / (2 x (ADCBAUD + 1))

Register 14-4 ADCDATAL– SARADC Buffer low byte control

Position	7	6	5	4	3	2	1	0
Name	ADCDATAL		-	-	-	-	-	-
Default	x	x	-	-	-	-	-	-
Access	RO	RO	-	-	-	-	-	-

Register 14-5 ADCDATAH– SARADC Buffer high byte control

Position	7	6	5	4	3	2	1	0
Name	ADCDATAH							
Default	x	x	x	x	x	x	x	x
Access	RO	RO	RO	RO	RO	RO	RO	RO

## 15 CRC16 /LFSR16/LFSR32

### 15.1 CRC16

#### 15.1.1 Features

Cyclic Redundancy Check (CRC) is an error-checking code that is widely used in data communication systems and other serial data transmission system. CRC is based on polynomial manipulation using modular arithmetic. The device supports CRC by a CRC circuit module. The CRC FIFO supports CRC-CCITT.

The CRC-CCITT polynomial is defined as:

$$\text{CRC}(x) = X^{16} + X^{12} + X^5 + 1$$

Figure 15-1 shows CRC FIFO block diagram.

Figure 15-1 CRC FIFO block diagram

Write CRCREG to initial CRC register. Write data into CRCFIFO after initialization, and data will be shifted into module from low bit to high bit. Get the results by reading CRCRES0 and CRCRES1.

#### 15.1.2 CRC16 Special Function Registers

Register 15-1 CRCREG– CRC initial register

Position	7	6	5	4	3	2	1	0
Name	CRCREG							
Default	1	1	1	1	1	1	1	1
Access	WO	WO	WO	WO	WO	WO	WO	WO

Write this location will initial CRC register.

**Note:** To initial the CRC register, user need to write 2 bytes to CRCREG for CRC16 (High byte first).

Register 15-2 CRCFIFO– CRC FIFO control

Position	7	6	5	4	3	2	1	0
Name	CRCFIFO							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Write this location will load the data to CRC module;

Register 15-3 CRCRES0– CRC result 0 control

Position	7	6	5	4	3	2	1	0
Name	CRCRES0							
Default	x	x	x	x	x	x	x	x
Access	RO	RO	RO	RO	RO	RO	RO	RO

Register 15-4CRCRES1– CRC result 1 control

Position	7	6	5	4	3	2	1	0
Name	CRCRES1							
Default	x	x	x	x	x	x	x	x
Access	RO	RO	RO	RO	RO	RO	RO	RO

## 15.2LFSR16

### 15.2.1 Features

Software can control lfsr16, or enable CRCEN of SPI1CON1 [1], hardware can auto trigger lfsr16 when spi1 receive data.

The LFSR16 polynomial is defined as:

$$\text{LFSR6}(x) = X^{16} + X^{15} + X^{14} + X^{12} + X^8 + X + 1$$

### 15.2.2 LFSR16 Special Function Register

Register 15-5 LFSR16\_DAT0– LFSR16 data 0

Position	7	6	5	4	3	2	1	0
Name	LFSR16_DAT0							
Default	1	1	1	1	1	1	1	1
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

**Note:** To initial the LFSR16 register, user need to write this register 2 times to LFSR16 register for LFSR16 (High byte first).Reading will output LFSR16 data0

Register 15-6 LFSR16\_DAT1– LFSR16 data 1

Position	7	6	5	4	3	2	1	0
Name	LFSR16_DAT1							
Default	1	1	1	1	1	1	1	1

Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R
--------	-----	-----	-----	-----	-----	-----	-----	-----

**Note:** Write this register, will trigger lfsr16 calculate one time; Reading will output LFSR16 data 1

## 15.3 LFSR32

### 15.3.1 Features

The LFSR32 polynomial is defined as:

$$\text{LFSR32}(x) = X^{32} + X^{26} + X^2 + 1$$

### 15.3.2 LFSR32 Special Function Registers

Register 15-7 LFSR32\_DAT0– LFSR32 data 0

Position	7	6	5	4	3	2	1	0
Name	LFSR32_DAT0							
Default	1	1	1	1	1	1	1	1
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

**Note:** To initial the LFSR32 register, user need to write this register 4 times to LFSR32 register for LFSR32 (High byte first).Reading will output LFSR32 data0

Register 15-8 LFSR32\_DAT1– LFSR32 data 1

Position	7	6	5	4	3	2	1	0
Name	LFSR32_DAT1							
Default	1	1	1	1	1	1	1	1
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

**Note:** Write this register, will trigger lfsr32 calculate one time; Reading will output LFSR32 data 1

Register 15-9 LFSR32\_DAT2– LFSR32 data 2

Position	7	6	5	4	3	2	1	0
Name	LFSR32_DAT2							
Default	1	1	1	1	1	1	1	1
Access	RO	RO	RO	RO	RO	RO	RO	RO

**Note:** Reading will output LFSR32 data 2

Register 15-10 LFSR32\_DAT3– LFSR32 data 3

Position	7	6	5	4	3	2	1	0
Name	LFSR32_DAT3							
Default	1	1	1	1	1	1	1	1
Access	RO	RO	RO	RO	RO	RO	RO	RO

**Note:** Reading will output LFSR32 data 3

## 16 Integrated Interchip Sound (IIS)

### 16.1 Features

IIS support Direct Memory Access mode and normal write buffer mode. The use of DMA mode can greatly decrease the load of CPU. And it is very simple to use.

Table 16-1 IIS pin mapping

Function	Pin ( IIS_3W==1 )		Pin ( IIS_3W==0 )		Description
	P_SEL==0	P_SEL==1	P_SEL==0	P_SEL==1	
IISREFCLK	P16				IIS Reference Clock
IISWS	P17	P26	P17	P26	IIS Word Select
IISBCLK	P13	P25	P13	P25	IIS Bit Clock
IISDI	P06	P23	P14	P22	IIS Data In
IISDO	P14	P22	P14	P22	IIS Data Out

Figure 16-1 shows the timing figure of IIS.

Figure 16-1 Timing of IIS in different mode

### 16.2 IIS Special Function Register

Register 16-1 IIS\_CON0

Position	7	6	5	4	3	2	1	0
Name	DATA_FMT		CH_SEL		LTHWS	SMP_EDGE	SLAVE	IIS_EN
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

#### DATA\_FMT:

00 = IIS format

01 = left align

10 = right align

**CH\_SEL:**

00 = both left &amp; right channel transfer

01 = only left

10 = only right

11 = reserved

**LTHWS:left channel to high WS**

0 = left channel data to low level WS,right to high level

1 = left channel data to high level WS,right to low level

**SMP\_EDGE: sample edge**

0 = right edge update data

1 = low edge update data

**SLAVE: IIS work at slave or Master mode**

0 = Master mode

1 = Slave mode

**IIS\_EN:**IIS enable.

Register 16-2 IIS\_CON1:

Position	7	6	5	4	3	2	1	0
Name	DMA_LOOP	SMP_SYNC		IIS_3W	OP_MOD		TXRX_MOD	
Default	0	0	0	1	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**DMA\_LOOP: IIS DMA data to memory, then DMA data out to IO**

0 = not loop

1 = loop

**SMP\_SYNC: sample IIS\_DI by IO or synchronization input**

00 = sample IO (master mode recommended)

01 = sample synchronization IO input(master mode)

1x = sample delay value of synchronization IO (slave mode recommended)

**IIS\_3W: iis DI/DO separately or not**

0 = not

1 = separately

**OP\_MOD:IIS data operation mode**

00 = data source come from cpu manual read/write

01 = data source come by DMA(to or from memorys)

10 = data source come from internal DAC output

11 = data source come from IO and to IO;LOOP\_OP;

Transfer out the data received,Data shift\_in/shift\_out by IO to IO;

#### **TXRX\_MOD:IIS data transfer work mode**

00 = enable rx only

01 = enable tx only

10 = enable rx,tx at the same time

Register 16-3 IIS\_CON2:write pending and error pending configuration

Position	7	6	5	4	3	2	1	0
Name	-	EXCEPT_ PND	TX_BUF_ EMP	TXRX_P ND	RD_OV_ PND	WR_OV_ PND	RD_HF_P ND	WR_HF_ PND
Default	-	0	0	0	0	0	0	0
Access	-	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**EXCEPT\_PND:error flag.when ws be shorter suddenly, will cause some error.**

R: 0 = not error

1 = error

W: 0 = clear

1 = not clear

**TX\_BUF\_EPT: indicate tx buffer empty or not**

R: 0 = not empty,then CPU can not write data to send out

1 = empty, CPU can write another 2 samples to send out

**TXRX\_PND:Some sample data have been received in or sent out**

R: 0 = not done

1 = done

16bit data mode,then pending up after 2 Left & Right or 4 single left or 4 single right sample done

other bit data mode,after 1 left & right or 2 left or 2 right sample channel data done,pnding up

W: 0 = clear

1 = not clear

**RD\_OV\_PND:number of dma read is equal to (IIS\_DMA\_CNT0~1)**

R: 0 = not finish

1 = finish

W: 0 = clear

1 = not clear

**WR\_OV\_PND:number of dma write is equal to (IIS\_DMA\_CNT0~1)**

R: 0 = not finish

1 = finish

W: 0 = clear

1 = not clear

**RD\_HF\_PND:**number of dma read is equal to  $(0.5 \times \text{IIS\_DMA\_CNT0} \sim 1)$

R: 0 = not finish

1 = finish

W: 0 = clear

1 = not clear

**WR\_HF\_PND:**number of dma write is equal to  $(0.5 \times \text{IIS\_DMA\_CNT0} \sim 1)$

R: 0 = not finish

1 = finish

W: 0 = clear

1 = not clear

Register 16-4 IIS\_CON3:read pending configuration

Position	7	6	5	4	3	2	1	0
Name	P_SEL				IIS_OV_RD_IE	IIS_OVF_WR_IE	IIS_HF_RD_IE	IIS_HF_WR_IE
Default	0				0	0	0	0
Access	R/W				R/W	R/W	R/W	R/W

**P\_SEL:** Choose the ports of do,di,ws and bclk

0: IISDO P14

IISDI P06

IIS\_WS P17

IIS\_BCLK P13

1: IISDO P22

IISDI P23

IIS\_WS P26

IIS\_BCLK P25

**IIS\_OV\_RD\_IE:** IIS dma read all number of data interrupt enable

0 = disable

1 = enable

**IIS\_OV\_WR\_IE:** IIS dma write all number of data interrupt enable

0 = disable

1 = enable

**IIS\_HF\_RD\_IE:** IIS dma read half number of data interrupt enable

0 = disable

1 = enable

**IIS\_HF\_WR\_IE:** IIS dma write half number of data interrupt enable

0 = disable

1 = enable

Register 16–5 IIS\_BAUD:

Position	7	6	5	4	3	2	1	0
Name	IISBAUD[7:0]							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**BAUDRATE: Master mode Bclk generate baudrate**

$BCLK = iis\_clk / (BAUDRATE + 1)$  or  $iis\_clk / (BAUDRATE + 2)$

BAUDRATE should bigger than 2 and small than 0xff

Register 16–6 IIS\_BCLK\_CFG:

Position	7	6	5	4	3	2	1	0
Name	-		IIS_BCLK_CFG					
Default	-	-	0	0	0	0	0	0
Access	-	-	R/W	R/W	R/W	R/W	R/W	R/W

**IIS\_BCLK\_CFG: For Master, adjust part Bclk period .**

when transmit or receive bit count less than this value, BCLK period cal by  $iis\_clk / (BAUDRATE + 1)$

when bigger or equal this value, BCLK become to  $iis\_clk / (BAUDRATE + 2)$

e.g :

$(F_{iis} / F_{sample}) / ((IIS\_ALLBIT + 1) * 2) = \text{quotient} + \text{remainder}$

baudrate = quotient - 1,

$IIS\_BCLK\_CFG = IIS\_ALLBIT - \text{remainder} / 2$  ;

**NOTE:** When DAC mode, if we set  $F_{iis} = 24M$ , and the value of  $(F_{iis} / F_{sample})$  we use is 544;

if we set  $F_{iis} = 48MM$ , and the value of  $(F_{iis} / F_{sample})$  we use is 1088;

Register 16–7 IIS\_ALLBIT:

Position	7	6	5	4	3	2	1	0
Name	-		IIS_ALLBIT					
Default	-	-	0	0	0	0	0	0
Access	-	-	R/W	R/W	R/W	R/W	R/W	R/W

**IIS\_ALLBIT: the bclk counts inside WS L or H**

user must configure this count, which is all bclks receive. during WS High or Low

Register 16–8 IIS\_VALBIT:

Position	7	6	5	4	3	2	1	0
Name	-			IIS_VALBIT				
Default	-	-	0	0	0	0	0	0
Access	-	-	R/W	R/W	R/W	R/W	R/W	R/W

**IIS\_VALBIT: the valid receive or send bits**

if IIS work at N bit mode, then write N-1 to this register.

this value should be smaller than or equal to IIS\_ALLBIT

Register 16–9 IIS\_DAT0-7: first group of IIS buffer

Position	7	6	5	4	3	2	1	0
Name	IIS_DAT0-7							
Default	x	x	x	x	x	x	x	x
Access	R	R	R	R	R	R	R	R

**IIS\_DAT0-7:** buffer of IIS group

Write: only write IIS\_DAT0 8 times ,

first write time is the highest bits

Read: read IIS\_DAT0 - DAT7.

IIS\_DAT0 is the highest bits, IIS\_DAT7 is the lowest bits

Register 16–10 IIS\_WSCNT0-1: calculate bclks between a ws period

Position	7	6	5	4	3	2	1	0
Name	IIS_WSCNT0-1							
Default	x	x	x	x	x	x	x	x
Access	R	R/W	R	R	R	R	R	R

**IIS\_WSCNT0-1:** calculate iis\_bclk between a ws period

Write: only write IIS\_WSCNT1 bit(6) to enable this function;

Read: Read IIS\_WSCNT0 - IIS\_WSCNT1, if the result is smp\_ws\_cnt;

$IIS\_WSCNT0 = smp\_ws\_cnt[7:0];$

$IIS\_WSCNT = \{1'h0, smp\_ws\_en, smp\_ws\_cnt[13:8]\};$

Register 16–11 IIS\_REFCLK\_CFG: iis reference clk configuration

Position	7	6	5	4	3	2	1	0
Name	--	--	IIS_REFCLK_CFG					
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**IIS\_REFCLK\_CFG:** iis reference clk configuration

if want to output IIS\_REFCLK, the bit 5 of this register should be written 1;

$F_{iis\_refclk} = F_{iis} / (IIS\_REFCLK\_CFG[4:0] + 1);$

Register 16–12 IIS\_ADR0: DMA write addr

Position	7	6	5	4	3	2	1	0
Name	IIS_ADR0							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

IIS\_ADR0: Write two times for dma write address.

first time is the higher address part, second time is the lower address part

Register 16–13 IIS\_ADR1: DMA read addr

Position	7	6	5	4	3	2	1	0
Name	IIS_ADR1							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

IIS\_ADR1: Write two times for dma read address.

first time is the higher address part, second time is the lower address part

Register 16–14 IIS\_DMA\_RD\_CNT0-1:

Position	7	6	5	4	3	2	1	0
Name	IIS_DMA_RD_CNT							
Default	1	1	1	1	1	1	1	1
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

**IIS\_DMA\_RD\_CNT0-1:** the counter of IIS DMA data, use for kick start DMA transfer and dma\_loop mode

Write:

Firstly, write IIS\_DMA\_RD\_CNT0 8 bits, this register is the low bits

secondly, write IIS\_DMA\_RD\_CNT1 2 bits, this register is the high bits, write this register is the same time to kick start DMA transfer

For iis dma one time is two buffers, IIS\_DMA\_RD\_CNT should be odd

the real data bits is :  $(\{IIS\_DMA\_RD\_CNT1, IIS\_DMA\_RD\_CNT0\} + 1) * 16$  bits

Register 16–15 IIS\_DMA\_WR\_CNT0-1:

Position	7	6	5	4	3	2	1	0
Name	IIS_DMA_WR_CNT							
Default	1	1	1	1	1	1	1	1
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

**IIS\_DMA\_WR\_CNT0-1:** the counter of IIS DMA data, use for kick start DMA rx and dma\_loop mode

Write:

Firstly, write IIS\_DMA\_WR\_D\_CNT0 8 bits, this register is the low bits

secondly, write IIS\_DMA\_WR\_CNT1 2 bits, this register is the high bits, write this register is the same time to kick start DMA rx

For iis dma one time is two buffers, IIS\_DMA\_WR\_CNT should be odd

the real data bits is :  $(\{IIS\_DMA\_WR\_CNT1, IIS\_DMA\_WR\_CNT0\} + 1) * 16$  bits

Register 16–16 IIS\_DMA\_RD\_P\_CNT0-1:

Position	7	6	5	4	3	2	1	0
Name	IIS_DMA_RD_P_CNT							

Default	1	1	1	1	1	1	1	1
Access	RO	RO	RO	RO	RO	RO	RO	RO

**IIS\_DMA\_RD\_P\_CNT0-1:** During the process of dma, we can know how many datas have been already read from the memory by reading these two registers.

IIS\_DMA\_RD\_P\_CNT0 is the lower bits and IIS\_DMA\_RD\_P\_CNT1 is the higher bits

Register 16–17 IIS\_DMA\_WR\_P\_CNT0-1:

Position	7	6	5	4	3	2	1	0
Name	IIS_DMA_WR_P_CNT							
Default	1	1	1	1	1	1	1	1
Access	RO	RO	RO	RO	RO	RO	RO	RO

**IIS\_DMA\_WR\_P\_CNT0-1:** During the process of dma, we can know how many datas have been already written to memory by reading these two registers.

IIS\_DMA\_WR\_P\_CNT0 is the lower bits and IIS\_DMA\_WR\_P\_CNT1 is the higher bits

## 16.3 Operation Guide

### 16.3.1 CPU RD/WR

- For 2-wire data mode, set IO direction, 1-wire Data input/output hardware auto control  
configure other IO direction. such as WS, BCLK, REFCLK (if need)
- if master mode, set BAUDRATE, IIS\_BCLK\_CFG, set IIS\_VALBIT, IIS\_ALLBIT for different bits transfer
- write IIS\_CON0-1 for Slave mode, sample edge, LTHWS, CH\_SEL, DATA\_FMT, TXRX\_MOD, OP\_MOD, IIS\_IE setting.
- enable IIS\_EN kick start RX/TX or both

For data receive, if both left and right channel data available, then hardware will halt until left channel is coming.

so if first receive right channel data, hardware will ignore it.

- Write IIS\_DAT0 8 times to send data out
- wait TX\_BUF\_EMPTY = 1, then write another 2 data to send, if tx
- wait IIS\_PND = 1, when rx mode, then read IIS\_DAT0-7 out

### 16.3.2 loop

this IIS support loop operation mode. that is send out data come from RX pin. and the tx data will delay 2-4 sample before really data come out. and the first 2-4 sample being send out is all 0s. must config OP\_MOD=2'b11;

### 16.3.3 DMA mode

- 1.conf IIS\_ADR0 and IIS\_ADR1
- 2.conf IIS\_BAUD,IIS\_BCLK\_CFG,IIS\_VALBIT,IIS\_ALLBIT
- 3.conf IIS\_CON0-1
4. conf IIS\_DMA\_RD\_CNT and IIS\_DMA\_WR\_CNT to kick start dma .
- 5.read DMA\_CNT\_PND which means 1 or 0.5 (IIS\_DMA\_CNT\*16) bits data transmit had finished.

## 17 PolyFuse control

### 17.1 PF Special Function Register

Register 17–1 PFCON

Position	7	6	5	4	3	2	1	0
Name					pf_done	pf_avdden	pf_rw	pf_cs
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**pf\_done:**

0 = pf access not done

1 = pf access done

**pf\_avdden:**

0 = pf avdd disable

1 = pf avdd enable

**pf\_rw:**

0 = read pf operation

1 = program pf operation

**pf\_cs:**

0 = pf cs disable

1 = pf cs enable

Register 17–2 PFBAUD

Position	7	6	5	4	3	2	1	0
Name	PFBAUD							
Default	1	1	1	1	1	1	1	1
Access	W	W	W	W	W	W	W	W

**PFBAUD: program or read pf speed**

PF SCLK high pulse = PFBAUD X system clock

PF SCLK low pulse = 1 X system clock

**Note:** This register can't set to zero

Register 17–3 PFDAT

Position	7	6	5	4	3	2	1	0
Name	PFDAT							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

**PFDAT:**

write this register will trigger access PF

Read this register will read one byte data from PF

Register 17–4 PFENC

Position	7	6	5	4	3	2	1	0
Name							rd_enc	wr_enc
Default	0	0	0	0	0	0	0	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

#### rd\_enc: PF read protection

0 = pr can be read by software

1 = pf can't be read by software

**Note:** This be can't be clear after set to 1

#### wr\_enc: PF write protection

0 = pf can be write by software

1 = pf can't be write by software

**Noter:** Write 0xd9 to PFENC will clear wr\_enc

## 17.2 PF user guideline

Write operation:

steps 0: write PFBAUD for program timing; clear wr\_enc

steps 1: set pf\_rw for write operation, delay for correct timing

steps 2: set pf\_avdden, delay for correct timing

steps 3: set pf\_cs, delay for correct timing

steps 4: write PFDAT for 8 bit program data

steps 5: check finish pending pf\_done

steps 6: repeat steps 4, 5 for finish 64 bit polyfuse program

steps 7: clear pf\_cs, delay for correct timing

steps 8: clear pf\_avdden, delay for correct timing

steps 9: clear pf\_rw for write operation, delay for correct timing

steps 10: set wr\_enc for protect polyfuse from unexpected writing

read operation:

steps 0: set pf\_cs, delay for correct timing

steps 1: write PFDAT will trigger read PF

steps 2: check finish pending pf\_done

steps 3: read PFDAT for 8bit polyfuse data output

steps 4: repeat 1, 2,3 for finish 64 bit polyfuse read

steps 5: set rd\_enc for protect polyfuse

# 18 Characteristics

## 18.1 PMU Parameters

Table 18-1 PMU Parameters

Sym	Characteristics	Min	Typ	Max	Unit	Conditions
BVIN	Buck input voltage	2.8	4.2	4.8	V	
VDDLDO	VDDLDO input voltage	2.8	4.2	4.8	V	
VOUT1V5	Buck output voltage	1.15	1.35	1.6	V	
VDDCORE	1.2V output voltage	-	1.2	-	V	
VDDRTC	input voltage	2.2	4.2	4.8	V	
VDDHP	3.0V output voltage	2.8	3.0	3.3	V	
VCM	1.5V output voltage	-	1.35	-	V	
RVDD	output voltage	1.1	1.2	1.3	V	
VDDIO	3.3V output voltage	2.8	3.3	-	V	

## 18.2 CORE PLL Parameters

Table 18-2 PLL Parameters

Sym	Characteristics	Min	Typ	Max	Unit	Conditions
F <sub>I1</sub>	Frequency input	-	32.768	-	KHz	Low frequency OSC
F <sub>I2</sub>	Frequency input	1	12	15	MHz	High frequency OSC
F <sub>OUT1</sub>	Frequency output	-	48	-	MHz	
T <sub>LOCK1</sub>	PLL locked time	-	2	-	ms	Use low frequency OSC as input reference
T <sub>LOCK2</sub>	PLL locked time	-	0.1	-	ms	Use high frequency OSC as input reference

## 18.3 General purpose I/O Parameters

Table 18-3 I/O Parameters

Symbol	Description	Min	Typ	Max	Units	Conditions
V <sub>IL</sub>	Low-Level input voltage	-	-	30% * VDDIO	V	VDDIO = 3.3V
V <sub>IH</sub>	High-level input voltage	70% * VDDIO	-	-	V	VDDIO = 3.3V
R <sub>PUP0</sub>	Internal pull-up resistor 0	-	10	-	KΩ	
R <sub>PUP1</sub>	Internal pull-up resistor 1	-	200	-	KΩ	
R <sub>PUP2</sub>	Internal pull-up resistor 2	-	0.5	-	KΩ	
R <sub>PDN0</sub>	Internal pull-down resistor 0	-	10	-	KΩ	
R <sub>PDN1</sub>	Internal pull-down resistor 1	-	0.33	-	KΩ	
R <sub>PDN2</sub>	Internal pull-down resistor 2	-	0.5	-	KΩ	
I <sub>LEVEL1</sub>	Level1 current driving	8	-	-	mA	For PORT1

Symbol	Description	Min	Typ	Max	Units	Conditions
I <sub>LEVEL2</sub>	Level2 current driving	24	-	-	mA	For Port1.1

## 18.4 Audio ADDA Parameters

Table 18-4 Audio DAC Parameters

Sym	Characteristics	Min	Typ	Max	Unit	Conditions
DAC SNR&DR		-	90	-	dB	48PIN
DAC SNR&DR		-	90	-	dB	28PIN & 20 PIN
DAC THD+N		-	-80	-	dB	10Kohm loading
PWR <sub>AB</sub>	ClassAB AMP power output	-	-	16	mW	32ohm loading
V <sub>PP</sub>	Maximum output voltage	-	-	2.6	V	10Kohm loading
ADC SNR/DR			93		dB	In Voice Band
ADC THD+N			89		dB	In Voice Band

## 18.5 USB PHY Parameters

Table 18-5 USB PHY Parameters

Sym	Characteristics	Min	Typ	Max	Unit	Conditions
RDM <sub>PUP</sub>	DM pull-up resistor	-	120	-	KΩ	
RDP <sub>PUP</sub>	DP pull-up resistor	-	1.5	-	KΩ	
RDM <sub>PDN</sub>	DM pull-up resistor	-	15	-	KΩ	
RDP <sub>PDN</sub>	DP pull-up resistor	-	15	-	KΩ	

## 18.6 RF Analog Blocks

Table 18-6 Frequency Synthesizer Parameters

Parameter	Condition		MIN	typ	max	Unit
Synthesizer						
Synthesizer settling time	Within +/- 25 KHz accuracy		-	70	-	us
Phase Noise	Fc=2.4GHz	ΔF=1 MHz	-	-110	-	dBc/Hz
		ΔF=2 MHz	-	-118	-	dBc/Hz
		ΔF≥3 MHz	-	-123	-	dBc/Hz
XTAL Oscillator						
Frequency range			-	26	-	MHz
Frequency Trimming Range	6 bits		-1	-	+1	kHz

Table 18-7 Receive path Parameters

Parameter	Condition	MIN	typ	max	Unit
Receiver Channel					
Minimum Usable Signal	RX sensitivity	-	-80	-	dBm
LNA					
Gain	High Gain	-	25	-	dB
	Mid Gain	-	15	-	dB
	Low Gain	-	5	-	dB
Mixer					
Conversion Gain		-	0	-	dB
IFamp					
Gain	5/9/12/15/18 dB	-	12	-	
Complex BPF					
Band pass -3 dB BW	Figure 1.	-	2	-	MHz
Image Rejection		-	30	-	dB
VGA					
Gain Range		-6	-	+68	dB
Gain Step		-	+1/+6	-	dB
ADMOD					
SNDR	Freq = +- BW	-	>50	-	dB

Table 18-8 Transmit path Parameters

Parameter	Condition	MIN	typ	max	Unit	
Transmit Channel						
Available output power		-2	0	1.5	dBm	
Side Band Suppression		-	-30	-	dBm	
LPF						
Low pass -3 dB BW	Figure 2.	-	1	-	MHz	
TXVGA						
Gain Step		-7	-	7	dB	
PA						
Gain Range	Set paPWR[2:0] of Control Register #16	GFSK	-12	-	4	dBm
		DPSK	-15	-	1	dBm
