1 Product Overview

1.1 Outline

CW6685X is an MCS-51™ Compatible high performance mixed signal microcontroller. It integrates advanced digital and analog peripherals to suit for Bluetooth audio playback and Bluetooth Communicate applications.

1.2 Features

- CPU Compatible with MCS-51™ instruction set;
- Compliant to Bluetooth 3.0 + EDR, backward-compatible with BT1.2, 2.0 and 2.1.
- Support HFP v1.6, HSP v1.2, A2DP 1.3, AVCTP 1.4, AVDTP 1.3 and AVRCP 1.5;
- Support SCMS-T content protection method;
- Class 2 power level, RF Performance: Tx:0dBm, Rx: -80dBm;
- Support simple pairing and auto reconnection function;
- Support MP3/SBC decoder;
- Support two pairs of AUX;
- Six Channels 10-bit SARADC;
- CW6685E/CW6685F support 16bit Stereo DAC with >90dB SNR, embedded with two class A/B headphone amplifier
- CW6685C/CW6685D support 16bit Mono DAC with >90dB SNR, embedded with two class A/B headphone amplifier
- 16bit Mono ADC with >90dB DR
- Support Audio record function to MIC ADPCM;
- Support Audio playback from SD/USB
- Keypad tone mixer;
- Two multi-function 8-bit timers, support Capture and PWM mode;
- Two multi-function 16-bit timers, support Capture and PWM mode;
- Watchdog Timer with on-chip RC oscillator;
- Support full-duplex IIS, UART, SPI, SD interface;
- Support IIC interface for FM function;
- 2 channels 16 levels Low Voltage Detector (0.2v/step);
- Power on Reset
- Support Full speed USB 2.0 PHY;
- Full speed USB 2.0 HOST/DEVICE controller;
- IR controller;
- Independent powered Real-Time Clock supporting 32.768kHz crystal
- Internal 26M crystal oscillator support ;
- Internal LDO regulator: 4.2V to 3.3V
- Built-in buck converter, DC-DC 4.2V to 1.9V

1.3 System Diagram

47	VDDIO	PWR	Power output VDDIO 3.3V
48	USBDM	I/O	USB Negative Input/output

3 CPU Core Information

3.1 Architecture

The AXC51-CORE of CW6685X is fully compatible with the MCS-51™ instruction set.

The AXC51-CORE employs a pipelined architecture that greatly increases its instruction throughput over the standard 8051 architecture. In a standard 8051, all instructions except for MUL and DIV take 12 or 24 system clock cycles to execute, and usually have a maximum system clock of 12MHz. By contrast, the AXC51-CORE executes most of its instructions in 1 system clock cycle. With system clock running at 48 MHz, it has a peak throughput of 48 MIPS running in on-chip SRAM area.

3.2 Instruction Set

The instruction set of the AXC51-CORE is fully compatible with the standard MCS-51™ instruction set; standard 8051 development tools can be used to develop software for the AXC51-CORE. All instructions of AXC51-CORE are the binary and functional equivalent of their MCS-51™ counterparts, including op-codes, addressing modes and effect on PSW flags. However, instruction timing is different than that of the standard 8051. [Table 3-1](#) shows AXC51-CORE Instruction Set Summary

Table 3-1 AXC51-CORE Instruction Set Summary

Number of Bytes	Mnemonic	Operands	Clock Cycles (running in IRAM)

3.2.1 Internal Data Memory Mapping

Internal data memory is mapped in [Figure 3-1](#). The memory space is shown divided into three blocks, which are generally referred to as the Lower 128, the Upper 128, and SFR space.

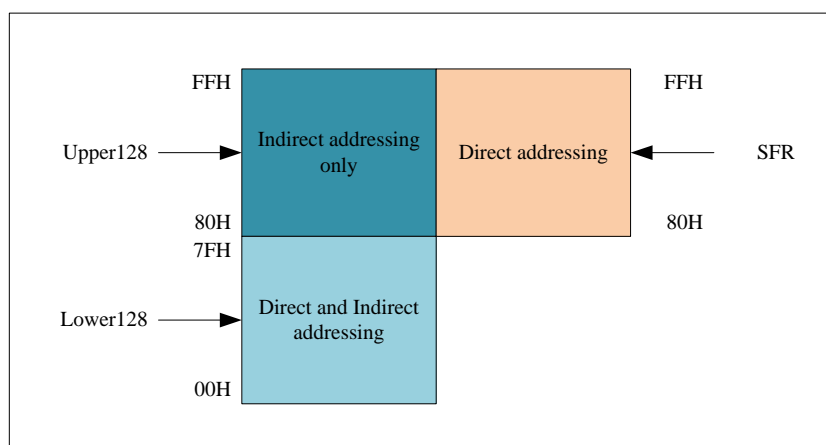

Figure 3-1 Internal data memory mapping

As shown in [Figure 3-2](#) the Lowest 32 bytes in Lower 128 are grouped into 4 banks of 8 registers. Program instructions call out these registers as R0 through R7. Two bits in the PSW select which register bank are in use.

Figure 3-2 Lowest 32 bytes in Internal data memory Lower 128

3.3 Interrupt Processing

3.3.1 Interrupt sources

The CW6685X provides 15 interrupt sources. All interrupts are controlled by a series combination of individual enable bits and a global enable (EA) in the interrupt-enable register (IE0.7). Setting EA to logic 1 allows individual interrupts to be enabled. Setting EA to logic 0 disables all interrupts regardless of the individual interrupt-enable settings. The interrupt enables and priorities are functionally identical to those of the 80C52.

The CW6685X provides 3 sets of vectors entry addresses, starting from 0x0003, 0x4003 and 0x8003. The vector base address is set by DPCON [7:6]. [Table 3-2](#) lists the interrupt summary.

Table 3-2 Interrupt Summary

3.3.2 Interrupt Priority

There are 4 levels of interrupt priority: Level 3 to 0. All interrupts have individual priority bits in the interrupt priority registers to allow each interrupt to be assigned a priority level from 3 to 0. All interrupts also have a natural hierarchy. In this manner, when a set of interrupts has been assigned the same priority, a second hierarchy determines which interrupt is allowed to take precedence. The natural hierarchy is determined by analyzing potential interrupts in a sequential manner with the order.

The processor indicates that an interrupt condition occurred by setting the respective flag bit. This bit is set regardless of whether the interrupt is enabled or disabled.

3.4 CPU and Memory related SFR Description

Register 3-1 DPCON – Data Pointer Configure Register

Position	7	6	5	4	3	2	1	0
Name	IA		DPID0	DPID1	DPAID	DPTSL	EINSTEN	DPSEL
Default	1	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

IA: Select Interrupt Vector's Base Address

00 = Base address is 0x0003

01 = Base address is 0x4003

10 = Base address is 0x8003

11 = Base address is 0xc003

Note: interrupt address is determined by SPMODE1 [4]

0 = interrupt base address depend on IA

1 = interrupt base address is 0x2000

DPID0: DPTR0 increase direction control

0 = DPTR increase

1 = DPTR decrease

DPID1: DPTR1 increase direction control

0 = DPTR increase

1 = DPTR decrease

DPAID: DPTR auto increment enables

0 = Auto increment disable

1 = Auto increment enable

DPTSL: DPSEL toggle enable

0 = DPSEL toggle disable

1 = DPSEL toggle enable

EINSTEN: Extern instruction enables

0 = Disable

1 = Enable

DPSEL: DPTR Select

0 = Active DPTR0

1 = Active DPTR1

Data Pointer Register is an 16-bit address pointer, it can split up into two register, DPL and DPH. Data pointer register always used as indirect addressing register.

Note: Interrupt address is determined by SPMODE1 [4]

Register 3-2 DPL0 – Data Pointer Low Byte

Position	7	6	5	4	3	2	1	0
Name	DPL0							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 3-3 DPL1 – Data Pointer Low Byte

Position	7	6	5	4	3	2	1	0
Name	DPL1							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 3-4 DPH0 – Data Pointer High Byte

Position	7	6	5	4	3	2	1	0
Name	DPH0							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 3-5 DPH1 – Data Pointer High Byte

Position	7	6	5	4	3	2	1	0
Name	DPH1							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The data pointers (DPTR0 and DPTR1) are used to assign a memory address for the MOVX instructions. This address can point to a MOVX RAM location. Two pointers are useful when moving data from one memory area to another. The user can select the active pointer through a dedicated SFR bit (DPSEL: DPCON.0), or can activate an automatic toggling feature for altering the pointer selection (DPTSL: DPCON.2). An additional feature, if selected, provides automatic incrementing or decrementing of the current DPTR.

Data pointer increment/decrement bits DPID0 (DPCON.5) and DPID1 (DPCON.4) define how the INC DPTR instruction functions in relation to the active DPTR.

The CW6685X offers a programmable option that allows any instructions related to data pointer to toggle the DPSEL bit automatically. This option is enabled by setting the toggle-select-enable bit (DPTSL) to logic 1.

Once enabled, the DPSEL bit is automatically toggled after the execution of one of the following 5 DPTR related instructions:

```

MOVC A, @A+DPTR
MOVX A, @DPTR
MOVX @DPTR, A
INC DPTR
MOV DPTR, #data16

```

The CW6685X also offers a programmable option that automatically increases (or decreases) the contents of the selected data pointer by 1 after the execution of a DPTR-related instruction. The actual function (increment or decrement) is dependent on the setting of the DPAID bits. This option is enabled by setting the automatic increment/decrement enable (DPAID: DPCON.3) to a logic 1 and is affected by one of the following 3 DPTR-related

instructions.

DPTR-related instructions are:

MOVC A, @A+DPTR

MOVX A, @DPTR

MOVX @DPTR, A

Register 3-6 SP – Stack Pointer Low Byte

Position	7	6	5	4	3	2	1	0
Name	SP							
Default	0	0	0	0	0	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 3-7 SPH – Stack Pointer High Byte

Position	7	6	5	4	3	2	1	0
Name	SPH							
Default	0	0	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

In a standard 8051, there is only an 8-bit stack pointer (SP). It can only use the internal 256 byte data memory as stack memory. To increase the stack space for more complex application, CW6685X supports a 16-bit extend stack pointer, it can use both internal data RAM and the 20K byte on-chip SRAM as stack memory. There are 2 registers for stack control.

Register 3-8 PSW – Processor Status Word

Position	7	6	5	4	3	2	1	0
Name	CY	AC	EC	RS1	RS0	OV	EZ	P
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

CY: Carry Flag

AC: Auxiliary carry flag

EC: Extern instruction Carry flag

RS1, RS0: Register bank select

00 = bank0

01 = bank1

10 = bank2

11 = bank3

OV: Overflow flag

EZ: Extern instruction zero flag

P: Odd parity check of ACC

0 = There are even number of '1' bits in ACC

1 = There are odd number of '1' bits in ACC

Register 3-9 SPMODE – Special mode

Position	7	6	5	4	3	2	1	0
Name	SINT0	SINT1	PWRUP	RAM2CEM	DACRAMCEM	DECRAMCEM	IRAMCEM	IROMCEM
Default	0	0	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

SINT0: Software 0 interrupts pending

0 = No software 0 interrupt

1 = Software 0 interrupt

SINT1: Software 1 interrupts pending

0 = No software 1 interrupt

1 = Software 1 interrupt

PWRUP: System power up flag

0 = CPU writes 0 to PWRUP.

1 = System power up or CPU writes 1 to PWRUP.

RAM2CEM: RAM2 CE mode control

0 = Always stay at 0

1 = Normal

DACRAMCEM: DAC RAM CE mode control

0 = Always stay at 0

1 = Normal

DECRAMCEM: DECRAM CE mode control

0 = Always stay at 0

1 = Normal

IRAMCEM: IRAM CE mode control

0 = Always stay at 0

1 = Normal

IROMCEM: IROM CE mode control

0 = Always stay at 0

1 = Normal

Register 3-10 SPMODE1 – Special mode 1

Position	7	6	5	4	3	2	1	0
Name	SDADCADOUTEN	SDADCDIEN	SPI1_MAP	INTADR_SEL	PAPAMODE	SPIINITMODE	SBCDEC_MEN	MP3DEC_MEN
Default					0	0	1	1
Access	R/W	R/W	R/W	R/W	RO	RO	R/W	R/W

SDADCADOUTEN: SDADC analog data out enable

0: disable

1: enable

SDADCDIEN: SDADC digital data input enable

0: disable

1: enable

SPI1_MAP: SPI1 port mapping

0 = Select P04, P05, P06

1 = Select P30, P31, P32

INTADR_SEL: interrupt address select

0: depend on DPCON IA

1: 0x2000

PAPAMODE : papa mode

0 = normal mode

1 = Parallel mode

SPIINITMODE : SPI Flash initial mode

0 = normal mode

1 = SPI initial mode

SBCDEC_MEN: SBC decoder module enables

0 = Disable

1 = Enable

MP3DEC_MEN: MP3 decoder module enables

0 = Disable

1 = Enable

Note: SPMODE1[1:0] register can be write to "0", but can't be write to "1" after writing "0".

Register 3-11 IE0 – Interrupt Enable 0

Position	7	6	5	4	3	2	1	0
Name	EA	IE06	IE05	IE04	IE03	IE02	IE01	IE00
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

EA: Global interrupt enable

0 = Disable

1 = Enable

IE06: USB SOF interrupt enable

0 = Disable

1 = Enable

IE05: Huffman/UART1 overflow interrupt enable

0 = Disable

1 = Enable

IE04: MP3 decoder and encoder interrupt enable

0 = Disable

1 = Enable

IE03: Timer2 interrupt enable

0 = Disable

1 = Enable

IE02: Timer1 interrupt enable

0 = Disable

1 = Enable

IE01: SINT1 interrupt enable

0 = Disable

1 = Enable

IE00: SINT0 interrupt enable

0 = Disable

1 = Enable

Register 3-12 IE1 – Interrupt Enable 1

Position	7	6	5	4	3	2	1	0
Name	IE17	IE16	IE15	IE14	IE13	IE12	IE11	IE10
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

IE17: SPI1 interrupt enable

0 = Disable

1 = Enable

IE16: RTCC/UART0/UART1/LVD/WDI/IIS interrupt enable

0 = Disable

1 = Enable

IE15: Timer0 interrupt enable

0 = Disable

1 = Enable

IE14: Timer 3 interrupt enable

0 = Disable

1 = Enable

IE13: SPI interrupt enable

0 = Disable

1 = Enable

IE12: Port interrupt enable

0 = Disable

1 = Enable

IE11: SDC interrupt enable

0 = Disable

1 = Enable

IE10: USB control interrupt enable

0 = Disable

1 = Enable

Register 3-13 IPH0 – Interrupt Priority high 0

Position	7	6	5	4	3	2	1	0
Name	IPH07	IPH06	IPH05	IPH04	IPH03	IPH02	IPH01	IPH00

4 Reset Generation

4.1 Power-on Reset (POR)

CW6685X provides an on-chip Power-On-Reset (POR) circuit to detect power-on and to reset internal logic before VDD reaches the pre-determined POR threshold voltage. When VDD=1.8V, the POR threshold voltage is set to be about 0.9V~1.5V.

Sometimes, when the VDD is power-off and quickly power-on again, there might be cases that the POR will work improperly and internal reset might not be generated. For this reason, CW6685X POR circuit incorporates an internal self-reset module to discharge PORB output during power-off to ensure each power cycle will work properly.

However, it is also highly recommended user should have a long time between power-off and next power-on to ensure proper start-up. The time depends on actual system board environment and how much decoupling capacitors between power and ground. User has to take into account this effect during board level design.

Figure 4-1 illustrates the power-on and reset signals waveform during proper power-on. Internally, there is TPOR and TRC time for both the POR circuit and the internal counter. TPOR is the time for the POR circuit to stay at zero voltage until it reaches VPOR and the time varies for different VDD rise-up time. It can be assumed to be about 2/3 of the VDD rise-up time. TRC is the time for internal counter to count 4ms using internal RC-oscillator when the counter sees a high logic from PORB signal. As a result, the overall internal reset time is the sum of TPOR and TRC. Such a long time is required to ensure the Power is stable for system use. It also ensures all internal logics are properly reset.

Figure 4-1 Power on reset

4.2 System Reset

All reset signals are OR'ed together inside the device to generate an overall system reset to reset the chip. Once reset, the program memory address is reset to 8000h, which is the start address of the Normal Mode. *Figure 4-2* illustrates the reset sources.

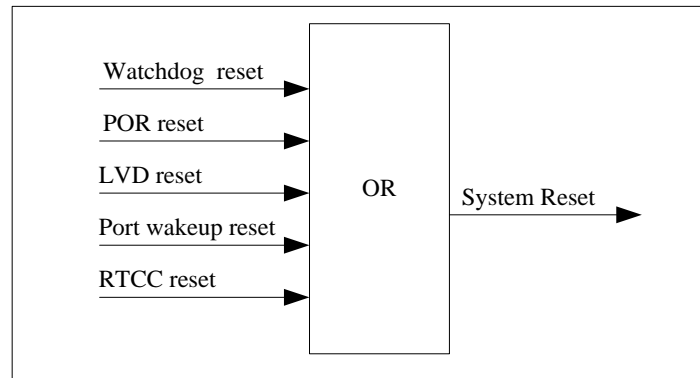

Figure 4-2 Reset Sources

4.2.1 LVD

CW6685X provides 4 levels programmable Low Voltage Detector (LVD) for user to detect VDDLDO power supply voltage or external pin voltage multiplexed with GPIO P2.2. It is for doing so since VDDLDO is the input voltage source for on-chip Low-Drop-Out regulator (LDO) and that supplies power to internal VDDCORE. User for such reason can momentarily monitor the VDDLDO power if externally connects to some batteries and detect if external power source starts dropping to a level that CW6685X LDO cannot tolerate and can do proper actions in the system program.

LVD can also be used to monitor external voltage source through the GPIO P2.2 to enhance programmability for different voltage levels. One of the examples can be used to monitor external power sources or batteries voltage or some voltages related to say pressure or temperature. It is there to provide a simple interface compared to ADC since ADC requires more programming space and procedures to detect precise voltage level. If user requires un-precise voltage detection without fine voltage range, LVD will be a good choice compared to ADC measurement.

[Table 4-1](#) illustrates different voltage detection levels.

Remark:

- When LVD_ENB is enabled, there is approximately 100us for the band-gap and the comparator to be stable before the end-user can use it as low voltage detection. During the time, LVD_OEB has to be H in order to disable the LVD output with possibly fluctuating signal level.
- Different power supply falling time will affect the voltage detection. It is recommended that the power supply falling time should be larger than 1ms for stable low voltage detection.

Upon detection occurs, interrupt can be generated if LVD interrupt is enabled, or, CW6685X can undergo reset if interrupt is disabled.

Note that the detection is slightly dependent on power supply falling rate and noise fluctuation during power drop may alter the detection results. For this reason, internally the comparator has about 150mV hysteresis voltage level defined as $V_{HYS} = V_{LVDR} - V_{LVDS}$ to filter out the noise may occur. Also, the detection level may have a maximum of 100mV difference compared to the value stated in [Table 4-1](#).

Table 4-1LVD level setting

BORS[2:0]	Detected VDDLDO V
3'b000	2.200

BORS[2:0]	Detected VDDLDO V
3'b001	2.333
3'b010	2.467
3'b011	2.600
3'b100	2.733
3'b101	2.867
3'b110	3.000
3'b111	3.133

For the best operation, below shows a recommended operation for the LVD.

1. Select either VDDLDO or external pin to be monitored. Set VD1_ENB = 0 for VDDLDO or VD2_ENB = 0 for external pin
2. Select the detection voltage by setting bits BORS[3:0]
3. Enable the LVD by setting LVD_ENB = 0
4. Wait for at least 30us for the internal band-gap and comparator to become stable
5. Enable the LVD output by setting LVD_OEB = 0
6. The EX_PIN detect voltage must be less than VDDIO

Register 4-1 LVDCON– LVD control

Position	7	6	5	4	3	2	1	0
Name	LVDIF	LVDRSTEN		LVDOE				
Default	0	1	0	0	1	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

LVDIF: LVD interrupt pending bit.

0 = When LVD threshold not detect. Cleared by writing a 0 to it

1 = When LVD threshold is detected

LVD_RSTEN: LVD Reset enable bit.

0 = LVD Reset is disabled

1 = LVD is enabled

LVD_OE: LVD output enable bit. Low active

0 = LVD output is enabled

1 = LVD output is disabled

4.2.2 RTCC Reset

CW6685X can be reset by RTCC second and alarm interrupt when IRTSTEN bit in RTCON is set to 1.

4.2.3 Watchdog Reset

If Watchdog timer is enabled, and WDTCON [5] is not written by 1 within watchdog overflow time period, CW6685X will be reset by Watchdog overflow.

4.2.4 Port Wakeup Reset

During SLEEP mode, port wakeup event will cause CW6685X reset.

4.3 Clock System

4.3.1 Clock Control

Shows the CW6685X clock management system. CW6685X embeds 32K/4M/12M/24M OSC internal oscillator circuits. External crystal is needed to generate a clock source. One internal PLL can generate 48MHz from the crystal clock source. One internal RC oscillator is also embedded.

To make sure the USB module operate properly, the USB clock must set to be 48MHz. In this case, system clock can be 48 MHz or 24MHz.

When the fraction is more than 0.80, set FOVER=1, and fraction = fraction/2, integer = integer

FRAC = fraction*65535

User guide:

1. PLL1 frequency division

PLL1 input reference clock is f0 (from RC or OSC), its internal dividing clock is 60M, frequency dividing ratio is 60M/f0.

Clock divide ratio consist of integer and decimal, the default value of integer part is 1831(default reference clock is 32.768k), the default value of decimal part is 0(only integral frequency division this time).

If f0=32.768k, frequency dividing ratio is 1831, decimal fraction part set 0.

If f0=12M, frequency dividing ratio is 5, decimal fraction part set 0.

If f0=4M, frequency dividing ratio is 15, decimal fraction part set 0.

2. If frequency dividing ratio is 58.a, then integer set 58, decimal fraction is a*65535.

3. PLL2 same as PLL1

5 Low Power Management

5.1 Power Saving Mode

CW6685X device has the low power management mode that can help reducing power consumption when the device does not require intensive CPU resources and speed. There are four low power modes available: SLEEP mode, Hold mode, IDLE mode and power down mode.

5.1.1 Sleep Mode

SLEEP mode is an ultimate power reduction mode that will stop all the clock sources, and all the memory chip select signals are disabled to further reduce power consumption. However, before entering sleep mode, all peripherals should be disabled separately, especially those analog peripherals and memory, unless those peripherals will stop themselves if no clock source is applied to the peripherals.

Note: Before Entering SLEEP mode, the system clock is recommended to change back to oscillator clock as the system clock.

To enter SLEEP mode, user need to write a '1' to SLEEP register (Bit0 of PCON0).

During SLEEP mode, the device can be wake up by either external port wakeup reset or watchdog reset or RTCC reset.

After exit SLEEP mode by wakeup, the device will be reset.

SLEEP mode will enable DEGRAM and IRAM and system clock automatically.

5.1.2 Hold Mode

HOLD mode will stop the clock from entering to system. The system clock is gated with the HOLD mode control. Once enter HOLD mode, clock to the system logic halts. Therefore, there will be no clock switching entering the system logic so that power consumption is minimized due to no AC switching. However, the clock sources are not disabled and they are still running. This allows the clock to be resumed in real time without waiting for the PLL to lock again. Watchdog interrupt, RTCC interrupt, Port interrupt and all reset event will cause system to exit HOLD mode.

TO enter HOLD mode, user need to write a '1' to HOLD register (Bit1 of PCON0).

When wakeup from HOLD Mode by port or RTCC, if interrupt is enabled, CW6685X enters corresponding interrupt service subroutine (ISR), else CW6685X will execute the instruction following HOLD.

When wakeup from HOLD Mode by watchdog, if watchdog reset enable, CW6685X will be reset, else if watchdog interrupt is enabled, CW6685X will enter watchdog's ISR. Else CW6685X will execute the instruction following HOLD.

5.1.3 Idle Mode

IDLE mode will stop the clock from entering to the CPU. The CPU clock is gated with the IDLE mode control. Once enter IDLE mode, clock to the CPU logic halts. Therefore, there will be no clock switching entering the CPU logic so CPU power consumption is minimized.

All interrupt sources will cause system to exit IDLE mode, which include all peripheral interrupt.

TO enter IDLE mode, user need to write a '1' to IDLE register (Bit2 of PCON0).

When exit IDLE mode, CW6685X will enter interrupt service subroutine if EA is enable. If EA is disabled, the instruction next to IDLE will be executed.

5.1.4 Power Down Mode

Power Down mode will disable core 1.8V and VDDIO 3.3V power, all the IO state, RAM, OTP, MROM and logic (except for IRTCC) will be power off. The content in RAM and logic disappears, should be initial after wake up.

Enter power down mode:

- 1) Disable the entire analog model
- 2) Select wake up source in WK_EN
- 3) Disable RC, RVDD, VDD1P8, VDD3P3, PMU, in PWRCON (RTC power field); RCEN, RVDD_EN, DVDD_EN, VDDIO_EN, PMU_EN

Power down mode wake up source:

- 1) RTC alarm wake up
- 2) RTC WKO pin wake up
- 3) RTC every minute wake up
- 4) RTC every day wake up

NOTE: After exit Power Down mode by wakeup, the device will be reset.

5.2 Power Supply

CW6685X provides two on-chip low drop-out regulators (LDO) to convert from 5V to 3.3V, 2.1V to 1.8V for internal core power use. It is there to provide high power supply noise rejection and also to minimize power consumption. LDO is always enabled.

CW6685X also provides Build-in buck converter, DC-DC 5V to 2.1V

To provide a more stable and reliable power source to internal core logic, it is recommended to add frequency compensation through external component. [Figure 5-1](#) shows the connection.

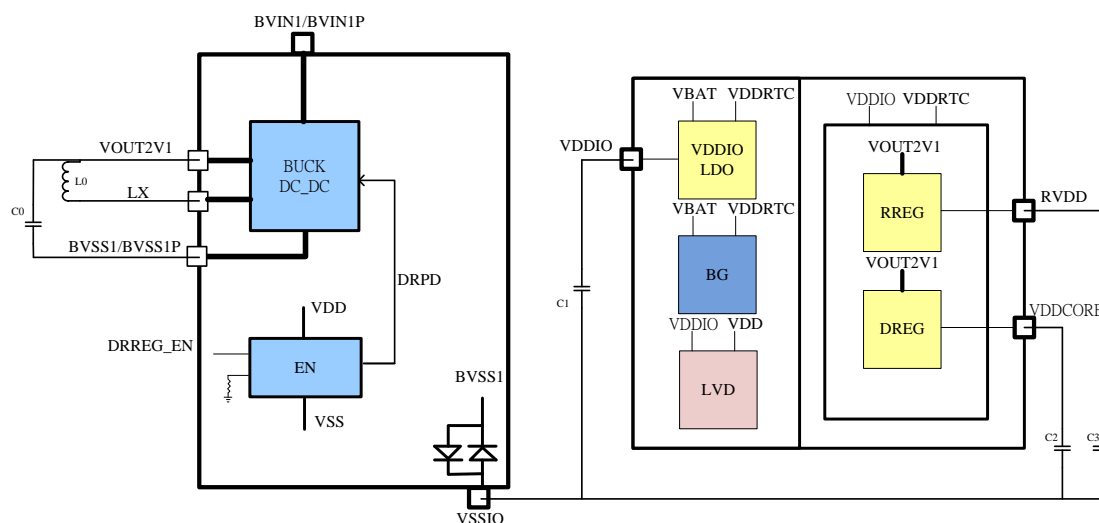

Figure 5-1 Frequency compensation through external component

Note:

- The recommended value for L0 is 10 uH.
- The recommended value for C0 is 10 uF.
- The recommended value for C1 is 10 uF.
- The recommended value for C2 is 10 uF.
- The recommended value for C3 is 10 uF.
- L0, Cx should be placed closely to the chip.

6 General Purpose Input/Output (GPIO)

6.1 Overview

The general purpose input/output port (GPIO) provides 30 dedicated general purpose one-bit contacts that can be individually configured as either inputs or outputs. Contacts configured as outputs reflect internal register values, and those configured as inputs can be detected by reading internal registers. All GPIOs are divided into 5 groups: Port0, Port1, Port2, Port3 and Port4.

6.2 Features

The GPIO includes the following features:

- Drive specific data to output using the data register;
- Control the direction of the signal using the GPIO direction register;
- Enable CPU to sample the status of the corresponding inputs by reading the data register;
- Enable internal pull-up resistor using pull-up resistor control register;
- Select suitable pull-up resistor value;
- Enable internal pull-up resistor using pull-down resistor control register;
- Select suitable pull-down resistor value;
- Select suitable output driving current capability;

There are 5 types of GPIO that can meet the variation of application requirements. [Table 6-1](#) shows the difference between pad types

Table 6-1 Pad types

Type	Driving (mA)		Pull-up resistor (Kohm)			Pull-down resistor (Kohm)				Mode
A	8	24	10	/	/	10	/	/	/	Normal
B	8	24	10	0.2	/	10	0.2	/	/	Normal
C	8	24	10	200	0.5	10	3.3	0.5	/	Normal
D	8	24	10	/	/	10	/	/	/	MUTE
E	/	/	/	/	/	/	/	/	/	Analog

6.3 Function multiplexing

In order to provide more flexible port functions and to minimize pin counts, some of the ports are multiplexed with other peripherals or functions. [Table 6-2](#) illustrates the “Ports multiplexed mapping”.

Several GPIO are multiplexed with analog module. GPIO digital input and output must be disabled when the corresponding analog module is enabled.

Table 6-2 Ports multiplexed mapping

Pins	Func1	Func 2	Func3	Func4	Func5	Func6	Func7	Fun8	Type
P00	AUXL0	UARTRX1		SDDAT1		SPI0DIN2			A
P01	AUXR0	UARTTX1	PORTINT/WKUP0	SDDAT2					A
P02	AUXL1					SPI0DOUT1	TMR1PWM		A
P03	AUXR1					SPI0CLK1	TMR0CAP		A
P04						SPI1DOUT/DIN1			A
P05						SPI1CLK			A
P06			PORTINT/WKUP1			SPI1DIN/SPI0DIN1	TMR0CKI/TMR1CKI	IISDI0	A
P07			PORTINT/WKUP3	Ir_input			TRM1CAP		A
P10					EMIWR				C
P11									C
P12									C
P13	ADC5							IISBCLK0	B

P41									A
P42						SPI1DIN1'			A
P43									A
P44	DACL								E
P45	DACR								E

6.4 Port interrupt and wakeup

CW6685X supports Port interrupt and wakeup function.

The PWKEN registers (Wakeup Enable Register) allow P01, P06, P34/DP/DM and P07 to cause wakeup.

The PWKEN registers are set to 0Fh upon reset. Clearing bit0-3 in the PWKEN register enables wakeup on corresponding pin of P01, P06, P34/DP/DM and P07. The trigger condition on the selected pin can be either rising edge or falling edge. The WKED register (Wakeup Edge Select) selects the desired transition edge. Setting a bit in WKED register selects the falling edge of the corresponding P01, P06, P34/DP/DM and P07 pin. Resetting the bit selects the rising edge.

Once a valid transition occurs on the selected pin, the WKPND (PWKEN.7~PWKEN.4) register (Wakeup Pending Register) latches the transition in the corresponding bit position. Logic '1' indicates the occurrence of the selected trigger edge on the corresponding Port pins. Upon reset, logic '0' is set to all bits of WKPND.

Note:

- To Wakeup initialization, to avoid any false signaling to port, the followings would be a recommended procedure for Wakeup initialization:
 - Configure the edge select of Port 0 pins on WKEDG register,
 - Clear the corresponding bits on WKPND Wakeup Pending Register
 - Clear the corresponding bits in the PWKEN registers to enable the wakeup on the corresponding port pins
- Upon exiting the sleep down mode, the Multi-Input Wakeup logic causes full chip reset.

6.5 GPIO Special Function Registers

Register 6-1 P0DIR-P0 direction Register

Position	7	6	5	4	3	2	1	0
Name	P0DIR							
Default	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

P0xDIR: P0x direction control

0 = Output

1 = Input

Register 6-2 P1DIR-P1 direction Register

Position	7	6	5	4	3	2	1	0
Name	P1DIR							
Default	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

P1xDIR: P1x direction control

0 = Output

1 = Input

Register 6-3 P2DIR-P2 direction Register

Position	7	6	5	4	3	2	1	0
Name	P2DIR							
Default	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

P2xDIR: P2x direction control

0 = Output

1 = Input

Register 6-4 P3DIR-P3 direction Register

Position	7	6	5	4	3	2	1	0
Name	P3DIR							
Default	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

P3xDIR: P3x direction control

0 = Output

1 = Input

Register 6-5 P4DIR-P4 direction Register

Position	7	6	5	4	3	2	1	0
Name	P4DIR							
Default	-	-	1	1	1	1	1	1
Access	-	-	R/W	R/W	R/W	R/W	R/W	R/W

P4xDIR: P4x direction control

0 = Output

1 = Input

Register 6-6 P0 – P0 data register

Position	7	6	5	4	3	2	1	0
Name	P0							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

P0[x]: P0x data. Valid when P0x is used as GPIO

0 = P0x is in low state when read and output low at P0x when write

1 = P0x is in high state when read and output high at P0x when write

Register 6-7 P1 – P1 data register

Position	7	6	5	4	3	2	1	0
Name	P1							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

P1[x]: P1x data. Valid when P1x is used as GPIO

0 = P1x is in low state when read and output low at P1x when write

1 = P1x is in high state when read and output high at P1x when write

Register 6-8 P2 – P2 data register

Position	7	6	5	4	3	2	1	0
Name	P2							
Default	x	x	x	x	x	x	x	x
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

P2[x]: P2x data. Valid when P2x is used as GPIO

0 = P2x is in low state when read and output low at P2x when write

1 = P2x is in high state when read and output high at P2x when write

Register 6-9 P3 – P3 data register

Position	7	6	5	4	3	2	1	0
Name	P3							
Default	x	x	x	x	x	x	x	x
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

P3[x]: P3x data. Valid when P3x is used as GPIO

0 = P3x is in low state when read and output low at P3x when write

1 = P3x is in high state when read and output high at P3x when write

Register 6-10 P4 – P4 data register

Position	7	6	5	4	3	2	1	0
Name	P4							
Default	-	-	x	x	x	x	x	x
Access	-	-	RO	RO	W/R	W/R	W/R	W/R

P3[x]: P3x data. Valid when P3x is used as GPIO

0 = P3x is in low state when read and output low at P3x when write

1 = P3x is in high state when read and output high at P3x when write

Table 6-3 DRVx register setting

Register	Address	Set bit “x” of PxDRV0 as “1”	Clear bit “x” of PxDRV0 as “0”	Initial value
P0DRV0	R/W	Driving is 24mA	Driving is 8mA	00h
P1DRV0	R/W	Driving is 24mA	Driving is 8mA	00h

01 = PLL 12MHz

10 = System clock

11 = XOSCO

WKEDGx: Port interrupts Edge Select

0 = Select rising edge as interrupt trigger event

1 = Select falling edge as interrupt trigger event

6.6 Operation Guide

Port 0 to Port 3 are memory-mapped into the Data Memory addressing space. They are respectively mapped into 80h, 90h, A0h and B0h registers for ports P0, P1, P2 and P3. Writing to a port data register sets the voltage levels of the corresponding port pins that have been configured to operate as outputs. Reading from a data register reads the voltage levels of the corresponding port pins.

As illustrated in Figure 8-1, there are major differences reading the port values when the port is set as input and output. When the port is set as output, the CPU will read the port value from Px register instead of the port pin value. When the port is set as input, the CPU will read the value from port pin directly instead of the port value from Px register. As a result, the user should be very careful when using Read-then-Write instructions to access the ports and change PxDIR before write the output value to Px when using port as output. For example:

Code assembler:

```
ANL P0DIR, #0FEH
```

```
MOV P0, #01h
```

Code C51:

```
P0DIR &= 0Xfe;
```

```
P0 = 0x01;
```

The first instruction in this example configures P00 as output, and then the second instruction writes the Port 0 data register (P0), which controls the output levels of the Port 0 pins, P00 through P07. Figure 8-1 shows the internal hardware structure and configuration registers for each pin of Port 0~3.

7 Timers

7.1 Timer0

Timer0 is an 8-bit timer/counter with a 7-bit prescaler. It can be configured as timer, counter or PWM generator.

Figure 7-1 shows the block diagram of Timer0 module.

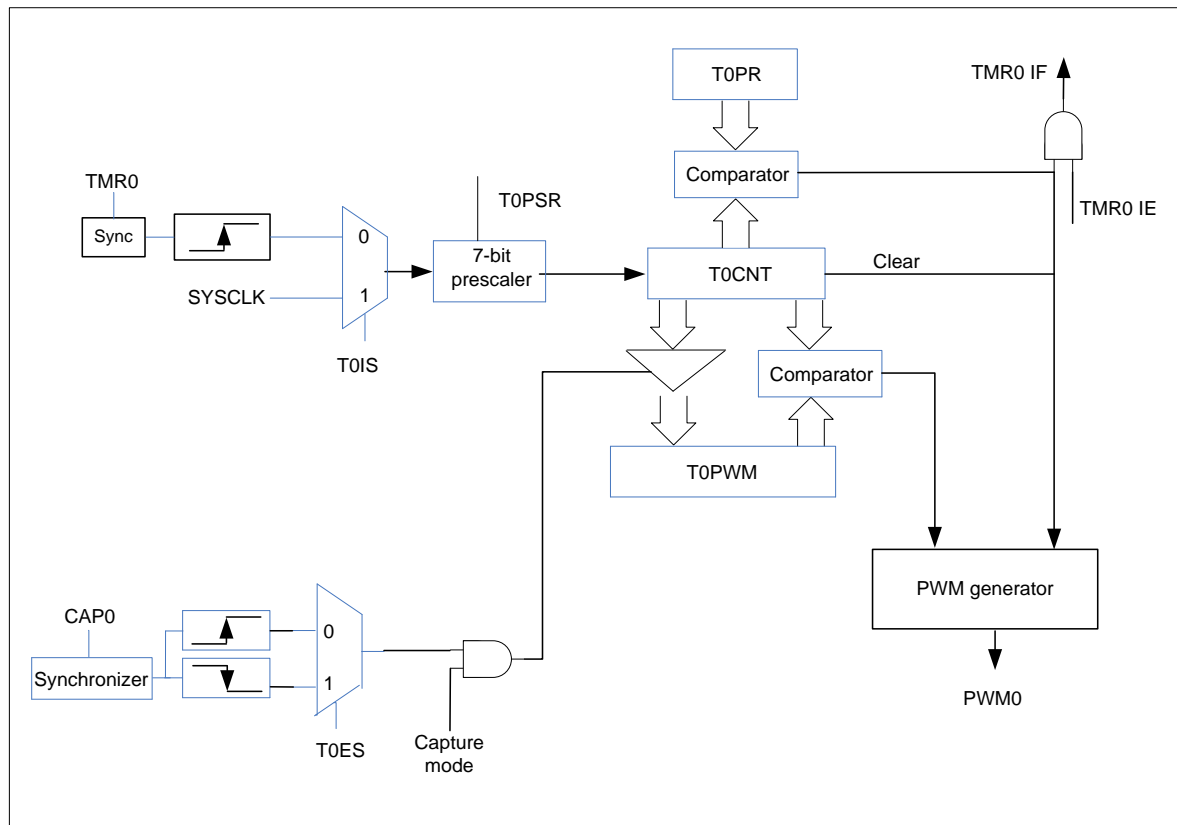

Figure 7-1 Timer0 Block Diagram

7.1.1 Timer0 Features

- 8bits counter
- 7bits pre-scaler
- Counter mode (clock source from system clock or TMR0)
- Capture mode (event source from CAP0)
- PWM mode (PWM signal output to PWM0)

7.1.2 Timer0 Special Function Registers

Register 7-1 TMR0CON – Timer0 control

Position	7	6	5	4	3	2	1	0
Name	T0PND	T0ES	T0M		T0IS	T0PSR		
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

T0PND: Timer0 Pending Flag

0 = Not Pending

1 = Pending

T0ES: Timer0 Capture Mode Edge Select

0 = CAP0 Rising Edge

1 = CAP0 Falling Edge

T0M: Timer0 Mode

00 = Timer0 is disabled

01 = Timer0 is enabled and works in Counter Mode

10 = Timer0 is enabled and works in PWM Mode

11 = Timer0 is enabled and works in Capture Mode

T0IS: Timer0 Increase Source

0 = Select system clock cycle

1 = Select TMR0 rising edge

T0PSR: Timer0 Prescaler

000 = Timer0 counts at every counting source event

001 = Timer0 counts at every 2 counting source events

010 = Timer0 counts at every 4 counting source events

011 = Timer0 counts at every 8 counting source events

100 = Timer0 counts at every 16 counting source events

101 = Timer0 counts at every 32 counting source events

110 = Timer0 counts at every 64 counting source events

111 = Timer0 counts at every 128 counting source events

Register 7-2 TMR0CNT – Timer0 Counter

Position	7	6	5	4	3	2	1	0
Name	TMR0CNT							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Timer0 will increase in proper condition while it is enabled. It overflows when TMR0CNT = TMR0PR, TMR0CNT will be clear to 0x00 when overflow occurs, and the interrupt flag will be set '1' by hardware.

Register 7-3 TMR0PR – Timer0 Period

- Counter mode (clock source from system clock or TMR1)
- Capture mode (event source from CAP1)
- PWM mode (PWM signal output to PWM1)

7.2.2 Timer1 Special Function Registers

Register 7-5 TMR1CON0 – Timer1 control 0

Position	7	6	5	4	3	2	1	0
Name	T1ES		T1M		T1CPSEL	T1IS		
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

T1ES: Timer1 Capture Edge Select

00 = CAP1 Rising Edge

01 = CAP1 Falling Edge

1X= CAP1 Rising Edge and Falling Edge

T1M: Timer1 Mode Select

00 = Timer1 is disabled

01 = Timer1 is enabled and works in Counter Mode

10 = Timer1 is enabled and works in PWM Mode

11 = Timer1 is enabled and works in Capture Mode

T1CPSEL: Timer1 capture input pin select

0 = Capture CAP1

1 = Capture IR1

T1IS: Timer1 Increase Source

000 = TMR1 Rising Edge

001 = TMR1 Falling Edge

010 = TMR1 Rising and Falling Edge

011 = External 32 KHz crystal oscillator

1xx = System clock cycle

Register 7-6 TMR1CON1 – Timer1 control 1

Position	7	6	5	4	3	2	1	0
Name	T1TPND	T1CPND	T1TIE	T1CIE	-	T1PSR		
Default	0	0	0	0	-	0	0	0
Access	R/W	R/W	R/W	R/W	-	R/W	R/W	R/W

T1TPND: Timer1 over Flow Pending Bit

0 = Not Pending

1 = Pending

T1CPND: Timer1 Capture mode Pending Bit

0 = Not Pending

1 = Pending

T1TIE: Timer1 over Flow Interrupt Enable Bit

0 = Interrupt Disable

1 = Interrupt Enable

T1CIE: Timer1 Capture mode Interrupt Enable Bit

0 = Disable

1 = Enable

T1PSR: Timer1 Prescaler

000 = Timer1 counts at every counting source event

001 = Timer1 counts at every 2 counting source events

010 = Timer1 counts at every 4 counting source events

011 = Timer1 counts at every 8 counting source events

100 = Timer1 counts at every 16 counting source events

101 = Timer1 counts at every 32 counting source events

110 = Timer1 counts at every 64 counting source events

111 = Timer1 counts at every 128 counting source events

Register 7-7 TMR1CNTH/TMR1CNTL – Timer1 Counter

Position	7	6	5	4	3	2	1	0
Name	TMR1CNTH/TMR1CNTL							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Timer1 will increase in proper condition while it is enable, it overflows when TMR1CNT = TMR1PR, TMR1CNT will be cleared to 0x0000 when overflow, and the interrupt flag will be set '1' by hardware.

Register 7-8 TMR1PRH/TMR1PRL – Timer1 Period

Position	7	6	5	4	3	2	1	0
Name	TMR1PRH/TMR1PRL							
Default	1	1	1	1	1	1	1	1
Access	WO	WO	WO	WO	WO	WO	WO	WO

The overflow period of the timer is: Tinc-source * T1PSR * (T1PR + 1).

Register 7-9 TMR1PWMH/TMR1PWML – Timer1 PWM duty

Position	7	6	5	4	3	2	1	0
Name	TMR1PWMH/TMR1PWML							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TMR1PWM is reserved in timer/counter mode. In PWM mode, it is used as duty cycle setting. In capture mode, the value of TMR1CNT will be captured to TMR1PWM when selected event occurs.

7.3 Timer2

Timer2 is a 16-bit timer/counter with a 7-bit prescaler. It can be configured as timer, counter or PWM generator.

Figure 7-3 Figure 7-3 shows the block diagram of Timer2 module.

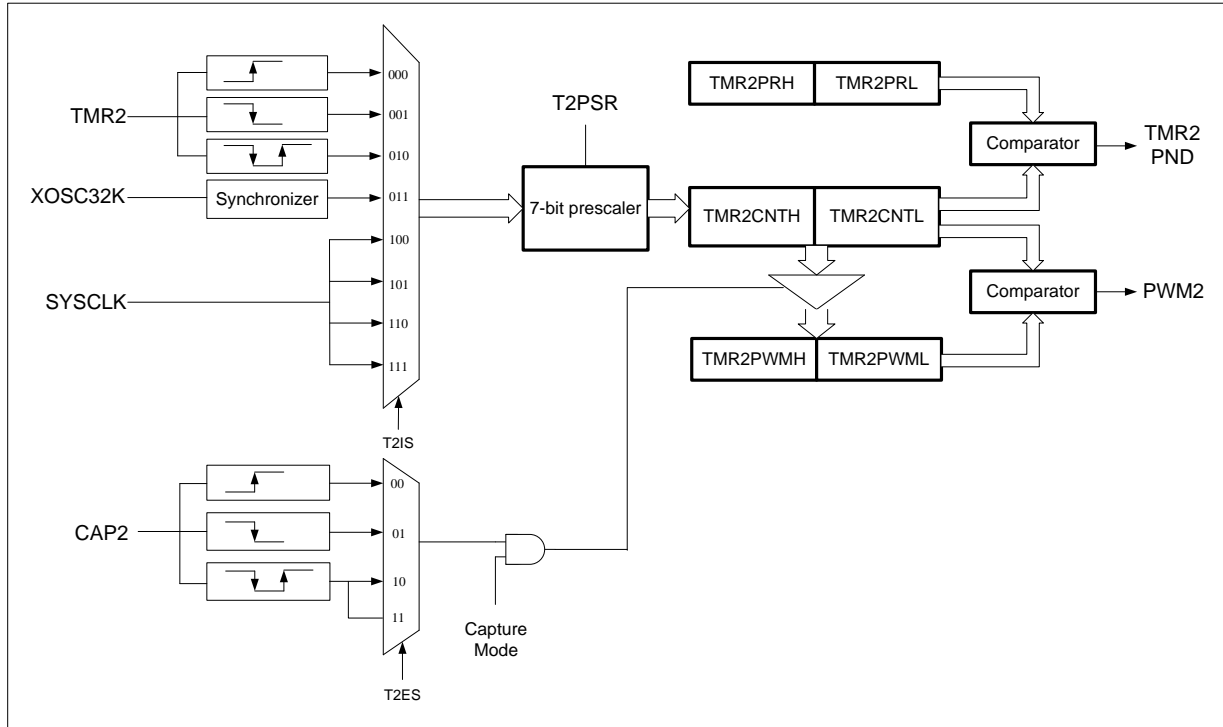

Figure 7-3 Timer2 Block Diagram

7.3.1 Timer2 Features

- 16bits counter
- 7bits pre-scaler
- Counter mode (clock source from system clock or TMR2)
- Capture mode (event source from CAP2)
- PWM mode (PWM signal output to PWM2)

7.3.2 Timer2 Special Function Registers

Register 7-10 TMR2CON0 – Timer2 control 0

Position	7	6	5	4	3	2	1	0
Name	T2ES		T2M		Reserve	T2IS		
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

T2ES: Timer2 Capture Edge Select

00 = CAP2 Rising Edge

01 = CAP2 Falling Edge

1X= CAP2 Rising Edge and Falling Edge

T2M: Timer2 Mode Select

00 = Timer2 is disabled

01 = Timer2 is enabled and works in Counter Mode

10 = Timer2 is enabled and works in PWM Mode

11 = Timer2 is enabled and works in Capture Mode

T2IS: Timer2 Increase Source

000 = TMR2 Rising Edge

001 = TMR2 Falling Edge

010 = TMR2 Rising and Falling Edge

011 = External 32 KHz crystal oscillator

1xx = System Clock cycle

Register 7-11 TMR2CON1 – Timer2 control 1

Position	7	6	5	4	3	2	1	0
Name	T2TPND	T2CPND	T2TIE	T2CIE	-	T2PSR		
Default	0	0	0	0	-	0	0	0
Access	R/W	R/W	R/W	R/W	-	R/W	R/W	R/W

T2TPND: Timer2 over Flow Pending Bit

0 = Not Pending

1 = Pending

T2CPND: Timer2 Capture mode Pending Bit

0 = Not Pending

1 = Pending

T2TIE: Timer2 over Flow Interrupt Enable Bit

0 = Interrupt Disable

1 = Interrupt Enable

T2CIE: Timer2 Capture mode Interrupt Enable Bit

0 = Disable

1 = Enable

T2PSR: Timer2 Prescaler

000 = Timer2 counts at every counting source event

001 = Timer2 counts at every 2 counting source events

010 = Timer2 counts at every 4 counting source events

011 = Timer2 counts at every 8 counting source events

100 = Timer2 counts at every 16 counting source events

101 = Timer2 counts at every 32 counting source events

110 = Timer2 counts at every 64 counting source events

111 = Timer2 counts at every 128 counting source events

Register 7-12 TMR2CNTH/TMR2CNTL – Timer2 Counter

Position	7	6	5	4	3	2	1	0
Name	TMR2CNTH/TMR2CNTL							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Timer2 will increase in proper condition while it is enable, it overflows when TMR2CNT = TMR2PR, TMR2CNT will be clear to 0x0000 when overflow, and the interrupt flag will be set '1' by hardware.

Register 7-13 TMR2PRH/TMR2PRL – Timer2 Period

Position	7	6	5	4	3	2	1	0
Name	TMR2PRH/TMR2PRL							
Default	1	1	1	1	1	1	1	1
Access	WO	WO	WO	WO	WO	WO	WO	WO

The overflow period of the timer is: Tinc-source * T2PSR * (T2PR + 1).

Register 7-14 TMR2PWMH/TMR2PWML – Timer2 PWM duty

Position	7	6	5	4	3	2	1	0
Name	TMR2PWMH/TMR2PWML							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TMR2PWM is reserved in timer/counter mode. In PWM mode, it is used as duty cycle setting. In capture mode, the value of TMR2CNT will be captured to TMR2PWM when selected event occurs.

7.4 Timer3

Timer3 is an 8-bit timer/counter with a 7-bit prescaler. It can be configured as timer, counter or PWM generator. [Figure 7-4](#) shows the block diagram of Timer3 module.

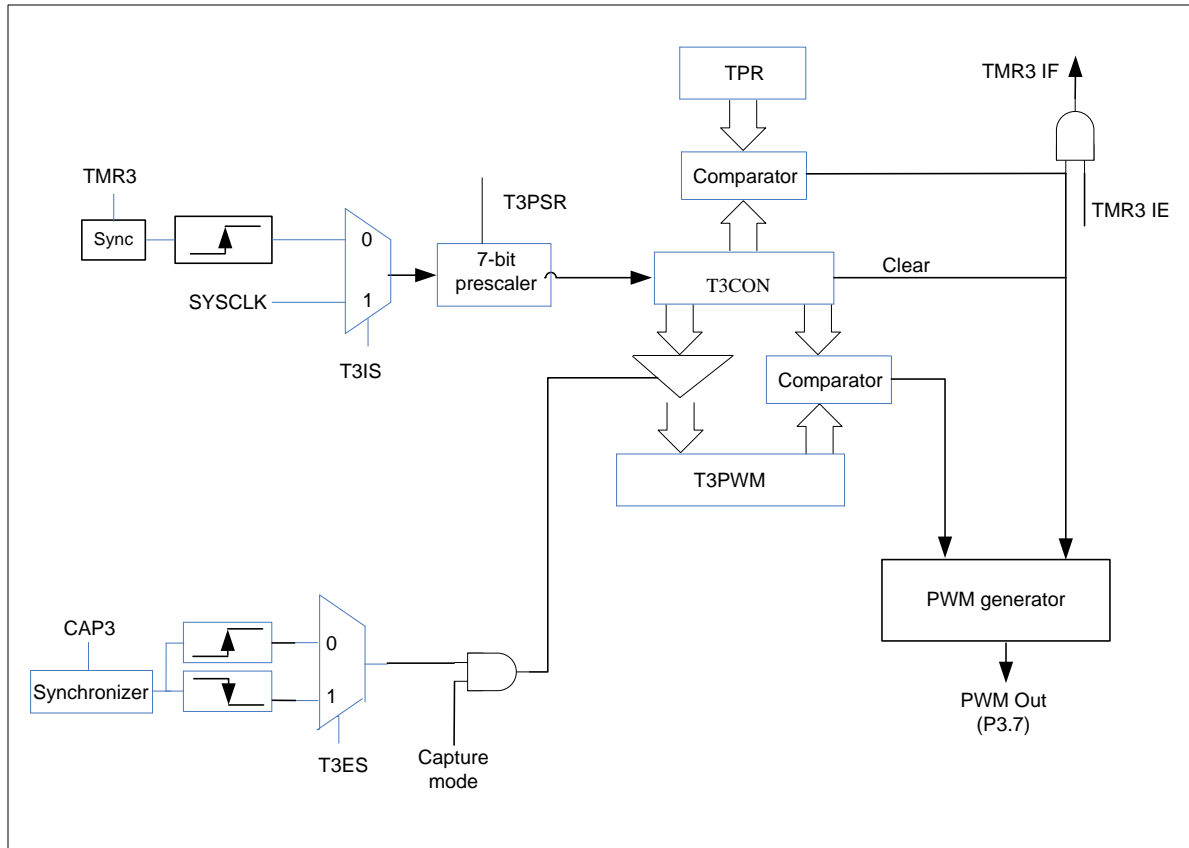

Figure 7-4 Timer3 Block Diagram

7.4.1 Timer3 Features

- 8bits counter
- 7bits pre-scaler
- Counter mode (clock source from system clock or TMR3)
- Capture mode (event source from CAP3)
- PWM mode (PWM signal output to PWM3)

7.4.2 Timer3 Special Function Registers

Register 7-15 TMR3CON – Timer3 control

Position	7	6	5	4	3	2	1	0
Name	T3PND	T3ES	T3M		T3IS	T3PSR		
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

T3PND: Timer3 Pending Flag

0 = Not Pending

1 = Pending

T3ES: Timer3 Capture Mode Edge Select

0 = CAP3 Rising Edge

1 = CAP3 Falling Edge

T3M: Timer3 Mode

00 = Timer3 is disabled

01 = Timer3 is enabled and works in Counter Mode

10 = Timer3 is enabled and works in PWM Mode

11 = Timer3 is enabled and works in Capture Mode

T3IS: Timer3 Increase Source

0 = System Clock

1 = TMR3 rising edge

T3PSR: Timer3 Prescaler

000 = Timer3 counts at every counting source event

001 = Timer3 counts at every 2 counting source events

010 = Timer3 counts at every 4 counting source events

011 = Timer3 counts at every 8 counting source events

100 = Timer3 counts at every 16 counting source events

101 = Timer3 counts at every 32 counting source events

110 = Timer3 counts at every 64 counting source events

111 = Timer3 counts at every 128 counting source events

Register 7-16 TMR3CNT – Timer3 Counter

Position	7	6	5	4	3	2	1	0
Name	T3CNT							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: Timer3 will increase in proper condition while it is enabled. It overflows when TMR3CNT = TMR3PR, TMR3CNT will be clear to 0x00 when overflow occurs, and the interrupt flag will be set '1' by hardware.

Register 7-17 TMR3PR – Timer3 Period

Position	7	6	5	4	3	2	1	0
Name	TMR3PR							
Default	1	1	1	1	1	1	1	1
Access	WO	WO	WO	WO	WO	WO	WO	WO

Note: The overflow period of the timer is: Tinc-source * T3PSR * (T3PR + 1).

Register 7-18 TMR3PWM – Timer3 PWM duty

Position	7	6	5	4	3	2	1	0
Name	TMR3PWM							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: TMR3PWM is reserved in timer/counter mode. In PWM mode, it is used as duty cycle setting. In capture mode, the value of TMR3CNT will be captured to TMR3PWM when selected event occurs.

7.5 Watchdog Timer (WDT)

The Watchdog Timer (WDT) logic consists of a 20bit Watchdog Timer. The Watchdog Timer is clocked by internal RC oscillator running at 32 KHz. When device resets, the WDT is disabled and user should enable the WDT if it is needed.

In the default configuration, WDT overflows in 2ms. The application program needs to write a '1' into WDTCON [5] at least once 2 ms to prevent WDT time out. The lower 3 bits of the WDTCON register control the selection of overflow time period.

7.5.1 Watchdog Wake up

WDT can be used to wake up CW6685X from Idle, Hold or Sleep mode. RSTEN bit (WDTCON [3]) is used to determine the actions after WDT wake up. When RSTEN sets to 0, the watchdog will generate a non-reset wake up after counter overflows. And When RSTEN sets to 1, the watchdog will wake up CW6685X by resetting the whole chip. After non-reset wake up CW6685X will continue to execute next instruction.

- During Idle mode, CW6685X can be wake up by WDT with interrupt or reset.
- During Hold mode, CW6685X can be wakeup by WDT with interrupt or reset or just continue to execute the next instruction.
- During Sleep mode, CW6685X can be wakeup by WDT with reset.
- During Deep Sleep mode, CW6685X cannot be wakeup by WDT.

7.5.2 Watchdog SFR

Register 7-19 WDTCON – Watchdog control

Position	7	6	5	4	3	2	1	0
Name	WDTPD	WDTTO	CLRWDT	WDTEN	RSTEN	WDTPS		
Default	0	0	0	1	1	1	0	1
Access	RO	RO	WO	R/W	R/W	R/W	R/W	R/W

WDTPD:

0 = read '0' before sleep operation

1 = read '1' after sleep operation

WDTTO:

0 = Read '0' after clear Watchdog or Power up

1 = Read '1' after Watchdog time out

CLRWDT:

1 = Clear WDT counter

0 = No action

WDTEN:

0 = Disables the Watchdog timer

1 = Enables the Watchdog timer

RSTEN:

0 = Disables the Watchdog reset

1 = Enables the Watchdog reset

WDTPS: WDT time out period setting

000 = 2ms

001 = 8ms

010 = 32ms

011 = 128ms

100 = 512ms

101 = 2048ms

110 = 8192ms

111 = 32768ms

7.6 Independent Power Real Time Clock Counter (IRTCC)

7.6.1 IRTCC Controller

IRTCC control can generate two interrupts: Second interrupt and Alarm interrupt.

IRTCC second interrupt can be enabled by writing 1 to IRTIE bit. When IRTCC works and IRTIE = 1, IRTCC second interrupt will be generated every 1 second by setting I RTPND to 1. I RTPND can be cleared by software by writing 0 to I RTPND bit.

IRTCC alarm interrupt can be enabled by writing 1 to IRTALIE bit. When IRTCC works and IRTALIE = 1, IRTCC alarm interrupt will be generated when the current time is equal to the pre-set time by setting IRTALPND to 1. IRTALPND can be cleared by software by writing 0 to IRTALPND bit.

IRTCC is divided to two parts; one part is IRTCC control. The power of IRTCC control is VDDCORE. Another part is IRTCC. The part of IRTCC is VDDRTC. The communication between two parts is use like SPI protocol.

7.6.2 IRTCC Timer

IRTCC timer can be power independently. It can work even other logic in CW6685X power off.

There is 6-bit valid address for the 64-byte user RAM. So the upper 2-bit of address in the writing RTC_RAM or reading RTC_RAM command are ignored. After one byte write/read, the internal address can increase automatically, this characteristic provide a burst mode to write/read the RAM. If the internal addresses increase greater than 63, it will roll back to 0.

7.6.3 Communication with IRTCC Timer

Special commands and corresponding parameters are used to communicate with IRTCC timer internal control or status registers and SRAM.

Table 7-1 IRTCC components communication commands

IRTCC component	Component type	Operation	Command Code	Command Parameters
Write_CFG(RTCCON)	A	Write	0x55	One byte
Read_CFG(RTCCON)	A	Read	0x54	One byte
Write_CFG3(RTCC3)	A	Write	0x59	One byte
Write_RTC	B	Write	0xF0	Four byte
Read_RTC	B	Read	0xE0	Four byte
Write_ALM	B	Write	0x53	Four byte
Read_ALM	B	Read	0x52	Four byte
Write_RAM	C	Write	0x57	One byte address and N byte data
Read_RAM	C	Read	0x56	One byte address and N byte data
Write_PWR(PWRCON)	A	Read	0x5a	One byte
Write_WKO(WKOCON)	A	Write	0x5b	One byte
Read_WKO(WKOCON)	A	Read	0xa1	One byte
Write_VCL(VOLTAGE)	A	Write	0xa2	One byte
Read_VCL(VOLTAGE)	A	Read	0xa3	One byte
Read_PWR(PWRCON)	A	Read	0xa4	One byte

Communication operations:

1, Read or write A type components

Write:

Read:

2, Read or write B type components

Write:

Read:

3, Read or write C type components

Write:

Read:

7.6.4 IRTCC Special Function Registers

Register 7-20 IRTCON – IRTCC control

Position	7	6	5	4	3	2	1	0
Name	IRTCSTEN	Reserved	IRTALPND	IRTALIE	IRTPND	IRTIE	DONE	EN
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

IRTCSTEN: IRTCC sleep wake up enable

0 = Disable

1 = Enable

IRTALPND: IRTCC alarm pending

0 = No pending (Write 0 to clear pending)

1 = Pending

IRTALIE: IRTCC alarm interrupt enable

0 = Disable

1 = Enable

IRTALIE must be '1' if IRTCC alarm is used to wake up system.

IRTPND: IRTCC second pending

0 = No pending (Write 0 to clear pending)

1 = Pending

IRTALIE: IRTCC alarm second enable

0 = Disable

1 = Enable

IRTIE must be '1' if IRTCC second is used to wake up system.

DONE: Communication done flag

0 = done

1 = not done

EN: IRTCC communications enable

0 = Disable

1 = Enable

Register 7-21 IRTCDAT – RTCC communication data

Position	7	6	5	4	3	2	1	0
Name	IRTCDAT							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Write to IRTCDAT will start IRTCC communication and set DONE flag to 1.

Read IRTCDAT will return IRTCC data.

Register 7-22 SECCNT –IRTCC timer counter

Position	7	6	5	4	3	2	1	0
Name	SECCNT7	SECCNT6	SECCNT5	SECCNT4	SECCNT3	SECCNT2	SECCNT1	SECCNT0
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

RTCC second counter

Register 7-23 IRTCON1 – RTCC control1

Position	7	6	5	4	3	2	1	0
Name	-	-	-	-	RTC_POR	IRTCC_POR_EN	TIMER	TIMERIE
Default	-	-	-	-		0	0	0
Access	-	-	-	-	R/O	R/W	R/W	R/W

RTC_POR: RTCC POR bit

0 = RTCC POR be 0

1 = RTCC POR be 1

NOTE: only design specification can be known.

IRTCC_POR_EN: IRTCC POR reset system clock enable

0 = Disable

1 = Enable

TIMER: Timer pending

0 = No pending (Write 0 to clear pending)

1 = When SECCNT equal to internal counter

TIMERIE: Timer pending interrupt enable

0 = Disable

1 = Enable

Register 7-24 RANDOM_CNT – random center regent

Position	7	6	5	4	3	2	1	0
Name	RANDOM_CNT[7:0]							
Default	-	-	-	-	-	-	-	-
Access	RO	RO	RO	RO	RO	RO	RO	RO

RANDOM: random center of 32k without default value

7.6.5 IRTCC components description

IRTCC timer can be power independently. It can work even other logic in TIGER is power off.

In IRTCC timer, there are one 8-bit configure register, one 32-bit real time counter, one 32-bit alarm register and 64-byte user RAM. All of these can be access (read or write) by several command sets through the IRTCC control.

There is 6-bit valid address for the 64-byte user RAM. So the upper 2-bit of address in the Write_RAM or Read_RAM command are ignored. After one byte write/read, the internal address can increase automatically, this characteristic provide a burst mode to write/read the RAM. If the internal address increase greater than 63, it will roll back to 0.

Register 7-25 RTCCON - RTCC control

Position	7	6	5	4	3	2	1	0
Name	32K_EN	12M_EN	WKOPOR_EN	WKO_CIN	F1HZEN	F32KHZEN	EX32KSEL	WKO32KOUT
Default	0	0	0	x	1	1	0	0
Access	R/W	R/W	R/W	RO	R/W	R/W	R/W	R/W

32K_EN: xosc 32k enable

0 = Disable

1 = Enable

12M_EN: xosc 12m enable

0 = Disable

1 = Enable

WKOPOR_EN: WKO wake up after core por rest enable bit

0 = Disable

1 = Enable

WKO_CIN: wko pin state read

F1HZEN: 1Hz signal output enables

0 = Disable

1 = Enable

F32KHZEN: 32KHz signal output enable

0 = Disable

1 = Enable

EX32KSEL: RTCC timer clock source select

0 = RTCC timer works with XOSC 32K.

1 = RTCC timer works with IRTOSC 32KHz

WKO32KOUT: WKO output RTC analog 32K XOSC

0 = Disable

1 = Enable

Register 7-26 RTCC3 - RTCC configure register3

Position	7	6	5	4	3	2	1	0
Name	-	-	-	XOSC_SHP_RTC	RFB_SEL_RTC	PDNEN	DRSEL	
Default	-	-	-	0	0	1	0	0
Access	-	-	-	WO	WO	WO	WO	WO

XOSC_SHP_RTC: XOSC shaping method select

0 = comparator

1 = Schmitt trigger

RFB_SEL_RTC: 32K XOSC feedback resistor select

0 = Disable

1 = Enable

PDNEN: pull down enable

0 = Disable

1 = Enable

DRSEL : IRTCC OSC drive select

Register 7-27 PWRCON - Power control register

Position	7	6	5	4	3	2	1	0
Name	PD_FLAG	BIAS_SEL		BUCK_MODE_SEL	RVDD_EN	DVDD_EN	VDDIO_EN	PMU_EN
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

PD_FLAG: Power down flag

BIAS_SEL [1:0]: LDO amp bias current selection

00 = X0

01 = X1

10 = X2, default

11 = X4

BUCK_MODE_SEL: PMU mode select bit

0 = LDO mode

1 = BUCK mode

RVDD_EN: RVDD enable bit

0 = Enable

1 = Disable

DVDD_EN: DVDD enable bit

0 = Enable

1 = Disable

VDDIO_EN: VDDIO enable bit

0 = Enable

1 = Disable

PMU_EN: PMU enable bit

0 = Enable

1 = Disable

Register 7-28 WKOCON - WKO control register

Position	7	6	5	4	3	2	1	0
Name	WKPIN_STA	FLTEN	ALMOE	WKOEN	WKOUTEN	WKOINEN	ALMEN	ALMOT
Default	0	0	0	0	0	0	0	X
Access	R/W	W/R	W/R	W/R	W/R	W/R	R/W	R/O

WKPIN_STA: Wake up pin output state

0 = wake up pin output 0 (60K pull down)

1 = wake up pin output 1 (10K pull up)

FLTEN: WKO 1ms filter enable

0 = Disable

1 = Enable

ALMOE: Alarm output enable at WKO PIN output enable

0 = Disable

1 = Enable

WKOEN: WKO PIN enables

0 = Disable

1 = Enabled

WKOUTEN: WKO PIN output enable bit

0 = Disable

1 = Enabled

WKOINEN: WKO PIN input enable bit

0 = Disable

1 = Enabled

ALMEN: Alarm function enables

0 = Disable

1 = Enable

ALMOT: Alarm match flag.

0 = No alarm match happen

1 = Alarm match

This flag is set to '1' by hardware when alarm register match real timer counter. It can be clear to '0' of ALMEN is set to '0' or 'Write_ALM' is detected.

Register 7-29 VCL VOLTAGE configure register

Position	7	6	5	4	3	2	1	0
Name	SC_RTC[4]	SC_RTC[3]	SC_RTC[2]	SC_RTC[1]	SC_RTC[0]	HVDS	HVDEN	LVDEN
Default	1	1	0	1	0	0	0	0
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

SC_RTC [4]: OSCO OSCI capacitance select

SC_RTC [3:2]: OSCO capacitance select

SC_RTC [1:0]: OSCI capacitance select

HVDS: HVD level select

Write :

0 = 4.0V

1 = 4.2V

Read: PWRCON bit1 VDDIO_EN

HVDEN: HVD enable bit

0 = Disabled

1 = Enabled

LVDEN: LVD enable bit

0 = Disabled

1 = Enabled

In IRTCC timer, there is one 32-bit real time counter. The unit of this counter is per second. If display the time on LCD, you should convert to second, minute, hour, date and so on. When use "Write_RTC" command to config this counter, the first byte is config the highest counter, and the forth byte is config the lowest counter. When use "Read_RTC" command to read this counter, the first byte output is the highest counter, and the forth byte output is the lowest counter.

In IRTCC timer, there is one 32-bit alarm register. The unit of this counter is per second. If display the time on LCD, you should convert to second, minute, hour, date and so on. When use "Write_ALM" command to config this counter, the first byte is config the highest counter, and the forth byte is config the lowest counter. When use "Read_ALM" command to read this counter, the first byte output is the highest counter, and the forth byte output is the lowest counter.

7.6.6 IRTCC Operating Guide

; Write RTC Config

Write_Cfg:

```

    ORL    IRTCON, #(1<<0)      ;RTC enable
    MOV    A, #55H
    CALL   Send_Dat
    MOV    A, #0CCH

8 Universal Asynchronous Receiver/Transmitter (UART)

8.1 UART0

8.1.1 Overview

UART0 is a serial port capable of asynchronous transmission. The UART0 can function in full duplex mode. Receive data is buffered in a holding register. This allows the UART0 to start reception of a second incoming data byte before software has finished reading the previous data byte. [Figure 8-1](#) illustrates the UART0 Block Diagram.

When PSEL = 0

- Receive pin (RX) – UART0RX0
- Transmit pin (TX) – UART0TX0

When PSEL = 1

- Receive pin (RX) – UART0RX1
- Transmit pin (TX) – UART0TX1

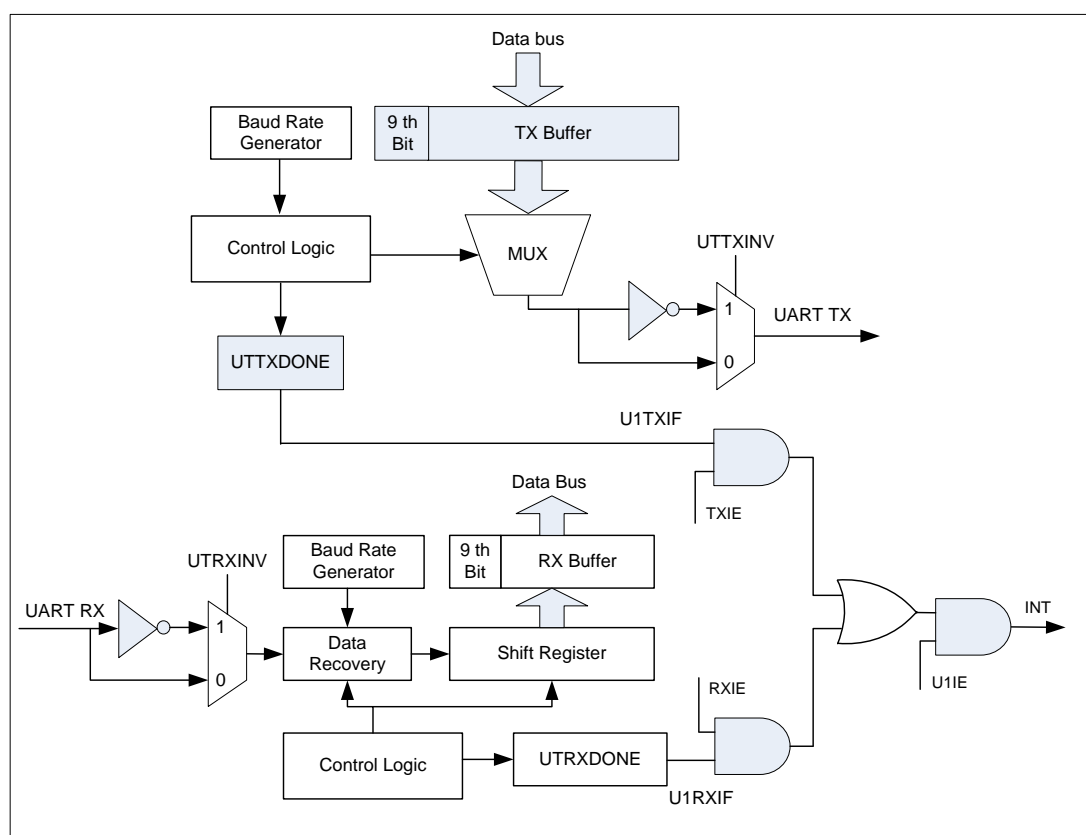

Figure 8-1 UART0 Block Diagram

8.1.2 UART0 Special Function Registers

Register 8-1 UARTCON – UART0 control

Position	7	6	5	4	3	2	1	0
Name	UTSBS	UTTXNB	NBITEN	UTEN	UTTXINV	UTRXINV	TXIE	RXIE
Default	0	1	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

UTSBS: Stop Bit Select

0 = 1 bit as Stop Bit

1 = 2 bits as Stop Bit

UTTXNB: The ninth bit data of transmitter buffer. Write the ninth bit into this location that you want to transmit

NBITEN: Nine-BIT mode Enable Bit

0 = Eight-bit mode

1 = Nine-bit mode

UTEN: UART Enable Bit

0 = Disable UART module

1 = Enable UART module

UTTXINV: Transmit Invert Selection Bit

0 = Transmitter output without inverted

1 = Transmitter output inverted

UTRXINV: Receive Invert Selection Bit

0 = Receiver input without inverted

1 = Receiver input inverted

TXIE: Transmit Interrupt Enable

0 = Transmit interrupt disable

1 = Transmit interrupt enable

RXIE: Receive Interrupt Enable

0 = Receiver interrupt disable

1 = Receiver interrupt enable

Register 8-2 UARTSTA – UART0 status

Position	7	6	5	4	3	2	1	0
Name	UTRXNB	FEF	RXIF	TXIF	-	-	-	PSEL
Default	x	x	0	1	-	-	-	0
Access	R/W	R/W	R/W	RO	-	-	-	R/W

UTRXNB: The ninth bit data of receiver buffer

FEF: Frame Error Flag

0 = the stop bit is '1' in the last received frame

1 = the stop bit is '0' in the last received frame

RXIF: RX Interrupt Flag

0 = RX not done

1 = RX done

TXIF: TX Interrupt Flag

0 = TX not done

1 = TX done

Writing data to UTBUF will clear this flag.

PSEL: UART0 Port Select

0 = Select UART0RX0 and UART0TX0

UART0RX0: P34

UART0TX0: P16

1 = Select UART0RX1 and UART0TX1

UART0RX1: P00

UART0TX1: P01

Register 8-3 UARTBAUDL – UART0 Baud Rate Low Byte

Position	7	6	5	4	3	2	1	0
Name	UARTBAUDL							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Register 8-4 UARTBAUDH – UART0 Baud Rate High Byte

Position	7	6	5	4	3	2	1	0
Name	UARTBAUDH							
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

UARTBAUD = {UARTBAUDH, UARTBAUDL}

Register 8-5 UARTDIV

Position	7	6	5	4	3	2	1	0
Name	UARTDIV							
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

Baud Rate = $F_{\text{sys clock}} / [(UARTBAUD + 1) \times (UARTDIV + 1)]$

Register 8-6 UARTDATA – UART0 Data

Position	7	6	5	4	3	2	1	0
Name	UARTDATA							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Write this location will load the data to transmitter buffer. And read this location will read the data from the receiver

buffer.

8.2 UART1

8.2.1 Overview

UART1 is a serial port capable of asynchronous transmission. The UART1 can function in normal and DMA full duplex mode. Please see PMUXCON0 bit 6 descriptions

When PMUXCON0 [6] == 0

- Receive pin (RX) – UART1RX0 (P17)
- Transmit pin (TX) – UART1TX0 (P16)

Or PMUXCON0 [6] == 1

- Receive pin (RX) – UART1RX1 (BT_TX)
- Transmit pin (TX) – UART1TX1 (BT_RX)

8.2.2 UART1 Special Function Registers

Register 8-7 UART1CON – UART1 control

Position	7	6	5	4	3	2	1	0
Name	UTSBS	UTTXNB	NBITEN	UTEN	TXIE	RXIE	OVERFLOWIE	DMASEL
Default	0	1	0	0	0	0	-	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	-	R/W

UTSBS: Stop Bit Select

0 = 1 bit as Stop Bit

1 = 2 bits as Stop Bit

UTTXNB: The ninth bit data of transmitter buffer. Write the ninth bit into this location that you want to transmit

NBITEN: Nine-BIT mode Enable Bit

0 = Eight-bit mode

1 = Nine-bit mode

UTEN: UART Enable Bit

0 = Disable UART module

1 = Enable UART module

TXIE: Transmit Interrupt Enable

0 = Transmit interrupt disable

1 = Transmit interrupt enable

RXIE: Receive Interrupt Enable

0 = Normal Receive interrupt disable or AUTO DMA mode Receive one word Interrupt disable

1 = Normal Receive interrupt enable or AUTO DMA mode Receive one word Interrupt enable

OVERFLOWIE: Receive DMA overflow interrupt enable

0 = overflow Interrupt disable

1 = overflow Interrupt enable

DMASEL: AUTO DMA choose

0 = AUTO DMA mode off

1= AUTO DMA mode on

Register 8-8 UART1STA – UART1 status

Position	7	6	5	4	3	2	1	0
Name	UART_GIE	-	UTRXNB	RX_BYTE_HIGH	RXIF	TXIF	OVERFLOWIF	RXKICK
Default	0	-	x	0	0	1	0	0
Access	R/W	-	R/W	RO	R/W	R/W	R/W	WO

UART_GIE: UART Global Interrupt 15 Enable

0 = UART Global I Interrupt disable

1 = UART Global I Interrupt enable

UTRXNB: The ninth bit data of receiver buffer

RX_BYTE_HIGH: receive data high byte(only for DMA)

0 = waiting receive data low byte

1 = waiting receive data high byte

RXIF: UART RX Interrupt Flag

0 = Normal Receive or AUTO DMA mode Receive one word not done

1 = Normal Receive or AUTO DMA mode Receive one word done

In normal mode, it become “1” every byte, but in DMA mode ,it become “1” every word.

TXIF: UART TX Interrupt Flag

0 = UART transmit not done

1 = UART transmit done

Writing data to UTBUF or Writing UARTDMATXCNT will clear this flag.

OVERFLOWIF: UART overflow Interrupt Flag

0 = UART overflow not done

1 = UART overflow done

RXKICK: UART DMA receive KICK start

0 = not KICK start

1 = KICK start

Register 8-9 UART1DIV – UART1 divide register

Position	7	6	5	4	3	2	1	0
Name	UART1DIV							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 8-10 UART1BAUD – UART1 Baud Rate register

Position	7	6	5	4	3	2	1	0
Name	UART1BAUD							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Baud Rate = Fsys clock / [(UARTDIV+1) (UART1BAUD + 1))

Register 8-11 UART1DATA – UART1 Data

Position	7	6	5	4	3	2	1	0
Name	UART1DATA							
Default	x	x	x	x	x	x	x	x
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Write this location will load the data to transmitter buffer. And read this location will read the data from the receiver buffer.

Register 8-12 UARTDMATXCNT –UART1 DMA Transmit counter

Portion	7	6	5	4	3	2	1	0
Name	UARTDMATXCNT							
Default	x	x	x	x	x	x	X	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Nbyte = UARTDMATXCNT + 1

Register 8-13 UARTDMATXPTR–UART1 DMA Transmit Start Pointer byte

Portion	7	6	5	4	3	2	1	0
Name	UARTDMATXPTR							
Default	x	x	x	X	x	x	X	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

In order to get the correct DMA Start Pointer , you should write this register twice. First write the higher byte, then the low byte. DMA address only map to SRAM1.

Register 8-14 UARTDMARXPTR–UART1 DMA receive Start Pointer byte

Portion	7	6	5	4	3	2	1	0
Name	UARTDMARXPTR							
Default	x	x	x	X	x	x	X	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

In order to get the correct DMA Start Pointer, you should write this register twice. First write the higher byte, then the low byte. DMA address only map to SRAM1.

Register 8-15 UART1MINUS–UART1 DMA receive data minus byte count by CPU

Portion	7	6	5	4	3	2	1	0
Name	UART1MINUS							
Default	x	x	x	X	x	x	X	x

Access	WO	WO	WO	WO	WO	WO	WO	WO
--------	----	----	----	----	----	----	----	----

Nbyte = UART1MINUS+ 1'b1

Register 8-16 UART1POINTL–UART DMA point by CPU read

Portion	7	6	5	4	3	2	1	0
Name	UART1POINTL							
Default	x	x	x	X	x	x	X	x
Access	R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O

Register 8-17 UART1POINTH–UART DMA point by CPU read high byte

Portion	7	6	5	4	3	2	1	0
Name	UART1POINTH							
Default	x	x	x	X	x	x	X	x
Access	R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O

Register 8-18 UART1LOOPCNT–UART DMA loop count

Position	7	6	5	4	3	2	1	0
Name				overflowcnt		dma_loop_cnt		
Default				0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

overflowcnt: less than bytes UART receive data ram size

00 = 4 bytes

01 = 8 bytes

10 = 16 bytes

11 = 32 bytes

dma_loop_cnt: UART receive data ram size

000 = 16 bytes

001 = 32 bytes

010 = 64 bytes

011 = 128 bytes

100 = 256 bytes

101 = 512 bytes

110 = 1K bytes

111 = forbidden

Register 8-19 UART1CNTH–UART DMA receive count high byte

Portion	7	6	5	4	3	2	1	0
Name	UART1CNTH							
Default	x	x	x	X	x	x	X	x
Access	R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O

Register 8-20 UART1CNTL–UART DMA receive count low byte

Portion	7	6	5	4	3	2	1	0
Name	UART1CNTL							
Default	x	x	x	x	x	x	x	x
Access	R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O

8.3 Operation Guide

1) UART1 Normal mode Operation Flow:

1. Set IO in the correct direction.
2. Configure UARTDIV and UART1BAUD to choose sample rate and baud.
3. Enable UART1 module by setting UTEN to '1'
4. Set TXIE or RXIE 'to 1' if needed
5. write data to UART1DATA
6. Wait for PND to change to '1', or wait for interrupt
7. Read received data from UART1DATA if needed
8. Go to Step 5 to start another process if needed or turn off UART1 by UTEN.

2) UART1 DMA Mode Operation Flow:

1. Set IO in the correct direction.
2. Configure UARTDIV and UART1BAUD to choose sample rate and baud.
3. Configure UART1CON Select DMA.
4. Write the start DMA address. for receive, Write data to UARTDMARXPTR
5. Enable UART module by setting UTEN to '1'.
6. Kick-start a DMA receive process
7. Wait overflow or delay some time, read UART1CNTH and UART1CNTL, read data by write UART1MINUS (UART1MINUS< {UART1CNTH, UART1CNTL}).
8. Write the start DMA address. For transmission, write data to UARTDMATXPTR.
9. Write data to UARTDMATXCNT to kick-start a DMA transmit process
10. Wait for PND to change to '1', or wait for interrupt

8.4 BT Control Register

Register 8-21 BTCON1 – BT control register1

Position	7	6	5	4	3	2	1	0
Name			BTC2RS	BTCDCLKO	BTCDCLKI	BTRSTB	TESTEN	XOSC26MEN
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	RO	R/W	R/W	R/W	R/W

BTC2RS: BTCON2 read select

0 = read BTCONT register

1 = read BT output state

BTCDCLKO: BT CDCLK output state

BTCDCLKI: BT CDCLK input state

TESTEN: test mode enables

0 = Disable BT PIN control by register

1 = Enable BT PIN share to GPIO

XOSC26MEN: BT xosc26M enable

0 = Disable

1 = Enable

Register 8-22 BTCON2 – BT control register2

Position	7	6	5	4	3	2	1	0
Name	BTTX	BTRX	BTCTS	BTTESTEN	BTGPIO10	BTGPIO9	BTGPIO5	BTGPIO4
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Write: write data to BT

Read: depend on BTCON1 [5]

9 IR receiver

CW6685X provides digital IR receiver, it can receiver IR data then CPU can read IR data from IR data buffer.

9.1 IR frame format

Figure 9-1 shows the IR data frame format

Figure 9-1 IR data frame format

Figure 9-2 shows the IR repeat frame format

Figure 9-2 IR repeat frame format

Figure 9-3 shows the IR bit 0 and bit 1 format

Figure 9-3 IR bit frame format

9.2 IR Receiver Control Registers

Register 9-1 IRCON0 - IR receiver control 0 register

Position	7	6	5	4	3	2	1	0
Name	-	-	-	IRPINSEL	IRREPEAT	IRPND	IRIE	IREN
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	R/W	RO	R/W	R/W	R/W

IRPINSEL: IR input pin select

0 = P07 as IR receiver input

1 = P33 as IR receiver input

IRREPEAT: IR receiver repeating data

0 = Not repeat

1 = Repeat

IRPND: IR receiver done

0 = Undone

1 = Done

IRIE: IR interrupt enable

0 = Disabled

1 = Enabled

IREN: IR enable

0 = Disabled

1 = Enabled

Register 9-2 IRCON1 - IR receiver control 1 register

Position	7	6	5	4	3	2	1	0
Name	IRCON1							
Default	0	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

The IRCON1 is the entrance for five 8-bit control registers: ONEFULL, ZEROCYC, REPEATCNT, ENDCONT and BEGINCNT. And IRCON1 must be written five times to update all the five control registers.

First time for the **ONEFULL**.

Position	7	6	5	4	3	2	1	0
Name	ONEFULL							
Default	1	0	0	1	1	1	0	0

When IR clock is 1 MHz, $\text{ONEFULL} \times 16 \times \text{CLKCYC}$ us is the time of IRDATA error. It is recommended to set ONEFULL to 0x9C. (**NOTE:** $\text{ONEFULL} \times 16 > \text{BIT 1 cycle}$),

When IR clock is 32 KHz, $\text{ONEFULL} \times \text{CLKCYC}$ us is the time of IRDATA error. It is recommended to set ONEFULL to 0x5E(**NOTE:** $\text{ONEFULL} \times 8 > \text{BIT 1 cycle}$)

Second time for the **ZEROCYC**.

Position	7	6	5	4	3	2	1	0
Name	ZEROCYC							
Default	0	1	0	1	0	0	0	0

When IR clock is 1 MHz, ZEROCYC*16*CLKCYC us is the cycle of IR BIT 0 and BIT 1 division. It is recommended to set ZEROCYC to 0x50. (**NOTE:** BIT 0 cycle < ZEROCYC*8 < BIT 1 cycle)

When IR clock is 32 KHz, ZEROCYC*CLKCYC us is the cycle of IR BIT 0 and BIT 1 division. It is recommended to set ZEROCYC to 0x28 (**NOTE:** BIT 0 cycle < ZEROCYC < BIT 1 cycle)

Third time for the **REPEATCNT**.

Position	7	6	5	4	3	2	1	0
Name	REPEATCNT							
Default	0	0	0	0	0	1	0	0

When IR clock is 1 MHz, REPEATCNT*512*CLKCYC us is the IR repeat pulse (2.3ms). It is recommended to set REPEATCNT to 0x04.

When IR clock is 32 KHz, REPEATCNT*32*CLKCYC us is the IR repeat pulse (2.3ms). It is recommended to set REPEATCNT to 0x02.

Fourth time for the **ENDCNT**.

Position	7	6	5	4	3	2	1	0
Name	ENDCNT							
Default	1	0	0	0	0	0	0	0

When IR clock is 1 MHz, ENDCNT *512*CLKCYC us is the IR incept high (4ms). It is recommended to set ENDCNT to 0x08.

When IR clock is 32 KHz, ENDCNT *32*CLKCYC us is the IR incept high (4ms). It is recommended to set ENDCNT to 0x09.

Fifth time for the **BEGINCNT**.

Position	7	6	5	4	3	2	1	0
Name	BEGINCNT							
Default	0	0	0	1	0	0	0	1

When IR clock is 1 MHz, BEGINCNT * 512*CLKCYC us is the IR incept low (9ms). It is recommended to set BEGINCNT to 0x11.

When IR clock is 32 KHz, BEGINCNT *32*CLKCYC us is the IR incept low (9ms). It is recommended to set BEGINCNT to 0x08.

NOTE: When IR clock is 1 MHz and BEGINCNT or ENDCNT or REPEATCNT is configured to N, the detect range is $N*512*cycle \sim (N*512+511)*cycle$.

NOTE: when IR clock is 32 KHz and BEGINCNT or ENDCNT or REPEATCNT is configured to N, the detect range is $N*32*cycle \sim (N*32+31)*cycle$

Register 9-3 IRDAT0 - IR receiver data buffer0 register

Position	7	6	5	4	3	2	1	0
Name	IRDAT0							
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	RO	RO	RO	RO	RO

Register 9-4 IRDAT1 - IR receiver data buffer1 register

Position	7	6	5	4	3	2	1	0
Name	IRDAT1							
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	RO	RO	RO	RO	RO

Register 9-5 IRDAT2 - IR receiver data buffer2 register

Position	7	6	5	4	3	2	1	0
Name	IRDAT2							
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	RO	RO	RO	RO	RO

Register 9-6 IRDAT3 - IR receiver data buffer3 register

Position	7	6	5	4	3	2	1	0
Name	IRDAT3							
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	RO	RO	RO	RO	RO

9.3 IR Receiver Operation Guide

- 1) Configure IR clock (CLKCON2);
- 2) Configure IRCON1 if needed;
- 3) Configure IRCON0;
- 4) Wait IRPND or IR interrupt;
- 5) Read IRDAT0/1/2/3.

10 SPI

10.1 SPI0

SPI0 can serve as master or slave. It can operate in normal or DMA mode.

SPI0 map to three group ports configured by PWKEDGE [6] and SPI0CON [3]:

Group0 - P27, P25, P26;

Group1 - P04, P06, P05;

Group2 - P14, P00, P34.

Group3 - P30(P40), P31, P32

When PWKEDGE[6]=0 and SPI0CON.3 = 0, Group0 actived

- 2wire mode: P2.6 as SPI0CLK0, P2.7 as SPI0DIDO0;
- 3wire mode: P2.6 as SPI0CLK0, P2.7 as SPI0DO2, P2.5 as SPI0DI0.

When PWKEDGE[6]=0 and SPI0CON.3 = 1, Group1 actived

- 2wire mode: P0.5 as SPI0CLK1, P0.4 as SPI0DIDO1;
- 3wire mode: P0.5 as SPI0CLK1, P0.4 as SPI0DO1, P0.6 as SPI0DI1.

When PWKEDGE[6]=1 and SPI0CON.3 = 0 Group2 actived

- 2wire mode: P3.4 as SPI0CLK2, P1.4 as SPI0DIDO2;
- 3wire mode: P3.4 as SPI0CLK2, P1.4 as SPI0DO2, P0.0 as SPI0DI2.

When PWKEDGE[6]=1 and SPI0CON.3 = 1, Grop3 actived

- 2wire mode: P3.0 as SPI0CLK3, P3.2 as SPI0DIDO3;
- 3wire mode: P3.0 as SPI0CLK3, P3.2 as SPI0DO3, P3.1 as SPI0DI3.
- when PMUXCON0[5] = 1 P4.0 as SPI0CLK3

Figure 10-1 SPI timing

10.1.1 SPI0 Special Function Registers

Register 10-1 SPI0CON – SPI0 control

Position	7	6	5	4	3	2	1	0
Name	SPI0PND	SPI0SM	SPI0RT	SPI0WS	SPI0PS0	SPI0EDGE	SPI0IDST	SPI0EN
Default	1	0	0	0	0	0	0	0
Access	RO	R/W	R/W	R/W	R/W	R/W	R/W	R/W

SPI0PND: SPI0 Pending bit (read only, writing SPI0BUF will clear this bit)

0 = Transmission is not finish

1 = Transmission finish

SPI0SM: SPI0 mode selection

0 = Master mode

1 = Slave mode

SPI0RT: SPI0 RX/TX select bit in 2-wire mode or DMA mode

0 = TX

1 = RX

In 3-wire mode, SPI0 can both Transmit and receive at the same time. But when using DMA mode or 2-wire mode, just one direction (TX or RX) is allowed. Use this bit to select TX or RX.

SPI0WS: SPI0 2-wire mode/3-wire mode select bit

0 = 3-wire mode

1 = 2-wire mode

SPI0PS0: SPI0 Port select 0

0 = Select P27, P25, P26 when SPI0PS1 = 0; Select P14, P00, P34 when SPI0PS1 = 1

1 = Select P04, P06, P05 when SPI0PS1 = 0

SPI0EDGE: SPI0 sampling edge select bit

When SPI0IDST = 0:

0 = Sample at falling edge

1 = Sample at rising edge

When SPI0IDST = 1:

0 = Sample at rising edge

1 = Sample at falling edge

SPI0IDST: SPI0 clock signal idle state

0 = Clock signal stay at 0 when idle

1 = Clock signal stay at 1 when idle

SPI0EN: SPI0 enable bit

0 = SPI0 disable

1 = SPI0 enable

Register 10-2 SPIBAUD – SPI0 Baud Rate

Position	7	6	5	4	3	2	1	0
Name	SPIBAUD							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

$$\text{Baud rate} = F_{\text{system_clock}} / [2(\text{SPIBAUD}+1)]$$

Register 10-3 SPI0BUF – SPI0 Data Buffer

Position	7	6	5	4	3	2	1	0
Name	SPI0BUF							
Default	x	x	x	x	x	x	x	X
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Register 10-4 SPIDMACNT – SPI0 DMA counter

Position	7	6	5	4	3	2	1	0
Name	SPIDMACNT							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

$$\text{Nunit} = \text{SPIDMACNT} + 1$$

$$\text{Nbyte} = \text{Nunit} * 2 = (\text{SPIDMACNT} + 1) * 2$$

Register 10-5 SPIDMAPTRH– SPI0 DMA Start Pointer high byte

Position	7	6	5	4	3	2	1	0
Name	SPIDMAPTRH							
Default	x	x	x	x	x	x	x	x

Access	WO	WO	WO	WO	WO	WO	WO	WO
--------	----	----	----	----	----	----	----	----

Register 10-6 SPIDMAPTRL– SPI0 DMA Start Pointer low byte

Position	7	6	5	4	3	2	1	0
Name	SPIDMAPTRL							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

10.1.2 SPI0 Operation Guide

When SPI0CON1.1=0,

SPI0 Normal Mode Operation Flow:

1. Set IO in the correct direction.
2. Select SPI0RT in 2-wire mode if 2-wire mode is selected
3. Select master mode or slave mode
4. Configure clock frequency when master mode is selected in step 3
5. Select one of the four timing mode (refer to *Figure 10-1*)
6. Enable SPI0 module by setting SPI0EN '1'
7. Set SPI0IE '1' if needed
8. Write data to SPI0BUF to kick-start the process
9. Wait for SPI0PND to change to '1', or wait for interrupt
10. Read received data from SPI0BUF if needed
11. Go to Step 8 to start another process if needed or turn off SPI0 by clearing SPI0IE and SPI0EN

SPI0 DMA Mode Operation Flow:

1. Set IO in the correct direction.
2. Select SPI0RT for DMA direction
3. Select master mode or slave mode
4. Configure clock frequency when master mode is selected in step 3
5. Select one of the four timing modes (refer to *Figure 10-1*)
6. Enable SPI0 module by setting SPI0EN to '1'
7. Set SPI0IE '1' if needed
8. Write the start address to SPI0DMASP
9. Write data to SPI0DMACNT to kick-start a DMA process
10. Wait for SPI0PND to change to '1', or wait for interrupt
11. Go to Step 8 to start another DMA process if needed or turn off SPI0 by clearing SPI0IE and SPI0EN

10.2 SPI1

CW6685X SPI1 is an accelerated SPI. It can serve as master only. It can operate in normal or DMA mode. Please see PMUXCON0 bit 5 descriptions

SPI1 uses 2 pins for 2 wire mode:

- Serial Data (SPIDIDO1) - P04
- Serial Clock (SPICLK1) - P05

SPI1 uses 3 pins for 3 wire mode:

When SPI1_MAP = 0,

- Serial Data Out (SPIDO1) - P04
- Serial Data In (SPIDI1) - P06
- Serial Clock (SPICLK1) - P05

When SPI1_MAP = 1,

- Serial Data Out (SPIDO0) - P04
- Serial Data In (SPIDI0) - P42
- Serial Clock (SPICLK0) - 05

10.2.1 SPI1 Special Function Registers

Register 10-7 SPI1CON – SPI1 Configure Register

Position	7	6	5	4	3	2	1	0
Name	SPI1PND	DMAERR	SPI1RT	SPI1WS	SPI1DEC			SPI1EN
Default	1	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	RO	RO	R/W

SPI1PND: SPI1 Pending bit (read only, writing SPI1BUF will clear this bit)

0 = Transmission has not finished

1 = Transmission finish

DMAERR: SPI1 DMA Error flag

0 = No DMA error

1 = DMA error happened.

SPI1RT: SPI1 RX/TX select bit in 2-wire or DMA mode

0 = TX

1 = RX

In 3-wire mode, SPI1 can both Transmit and receive at the same time. But if we use DMA mode or 2-wire mode, just one direction (TX or RX) is allowed. Use this bit to select TX or RX.

SPI1WS: SPI1 2-wire mode/3-wire mode select bit

0 = 3-wire mode

1 = 2-wire mode

SPI1DEC: SPI1 decryption function enables

0 = Disabled

1 = Enabled

SPI1EN: SPI1 enable bit

0 = SPI1 disabled

1 = SPI1 enabled

Register 10-8 SPI1CON1 – SPI1 Configure Register1

Position	7	6	5	4	3	2	1	0
Name	-	-	-	-	-	-	CRCEN	ENCRYPT
Default	-	-	-	-	-	-	0	0
Access	-	-	-	-	-	-	R/W	R/W

CRCEN: SPI1 CRC enable when SPI1 receiving data

0 = Disabled

1 = Enabled

ENCRYPT: SPI1 output encryption function enable

0 = Disabled

1 = Enabled

NOTE: ENCRYPT and SPI1DEC cannot be 1 at the same time.

Register 10-9 SPI1BUF – SPI1 Data Buffer

Position	7	6	5	4	3	2	1	0
Name	SPI1BUF							
Default	X	x	x	x	x	x	x	X
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Write this location to load the data to transmitter buffer and kick start the SPI transmission, read this location will read the data from the receiver buffer.

Register 10-10 SPI1DMASPH– SPI1 DMA Pointer

Position	7	6	5	4	3	2	1	0
Name	-	-	SPI1DMASPH					
Default	0	0	x	x	x	x	x	x
Access	-	-	WO	WO	WO	WO	WO	WO

SPI DMA start address pointer, point to the start address in IRAM that the data to be transmitted or data to be stored.

Register 10-11 SPI1DMASPL– SPI1 DMA Pointer

Position	7	6	5	4	3	2	1	0
Name	SPI1DMASPL							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Register 10-12 SPI1DMACNTH – SPI1 DMA Counter High byte

Position	7	6	5	4	3	2	1	0
Name	SPI1DMACNTH							
Default	X	X	x	X	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

Register 10-13 SPI1DMACNTL – SPI1 DMA Counter Low Byte

Position	7	6	5	4	3	2	1	0
Name	SPI1DMACNTL							
Default	X	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

SPI DMA counter, decide the amount of units to be transmitted or received. There is 2 bytes in a unit. DMA counter is range from 0 to 2047 words. And there is a formula as follow:

$SPIDMACNT = \{SPIDMACNTH, SPIDMACNTL\}$

$Nunit = SPIDMACNT + 1$

$Nbyte = Nunit * 2 = (SPIDMACNT + 1) * 2$

Write this location will enable DMA and kick start a DMA process .Caution: do not write 0 to this register.

Note: Must write SPIDMACNTH, then write SPIDMACNTL, this order can't change.

Register 10-14 SPI1BAUD – SPI1 BAUD RATE

Position	7	6	5	4	3	2	1	0
Name	SPI1BAUD							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

SPI Baud Rate, from 0 to 255

SPI Clock is System Clock / (SPI1BAUD + 1) , If SPI1BAUD is 0, then SPI Clock is same as System Clock.

10.2.2 SPI1 Operation Guide

A. SPI Normal Mode Operation Flow:

1. Set IO in the correct direction.
2. Select SPI1WS in 2-wire mode or 3 wire mode.
3. Select SPI1RT for reception or transmission.
4. Configure clock frequency using bit SPI1SP.
5. Enable SPI module by setting SPI1EN '1'
6. Set SPI1IE '1' if needed
7. Write data to SPI1BUF to kick-start the process
8. Wait for SPI1PND change to '1', or wait for interrupt
9. Read received data from SPI1BUF if needed

10. Go to Step 7 to start another process if needed or turn off SPI1 by clearing SPI1PND and SPI1EN

B. SPI DMA Mode Operation Flow:

1. Set IO in the correct direction.
2. Select SPI1RT for DMA direction
3. Select SPI1WS in 2-wire mode or 3 wire mode
4. Configure clock frequency using bit SPI1SP
5. Enable SPI module by setting SPI1EN '1'
6. Set SPI1IE '1' if needed
7. Write the start address to SPI1DMASP
8. Write data to SPI1DMACNT to kick-start the DMA process.
9. Wait for bit SPI1PND to change to '1', or wait for interrupt
10. Go to Step 7 to start another DMA process if needed or turn off SPI by clearing SPI1PND and SPI1EN

11 External Memory Interface (EMI)

CW6685X provides External Memory Interface (EMI) to accelerate data transfer. [Figure 11-1](#) shows EMI timing.

Figure 11-1 EMI timing

11.1 EMI Control Registers

Register 11-1 EMICON0 – EMI control0

Position	7	6	5	4	3	2	1	0
Name	EMIEN	EMIPW			EMIHT		EMIST	
Default	1	0	0	0	0	0	0	0
Access	WO	WO	WO	WO	WO	WO	WO	WO

EMIEN:

When writing: EMI Enable

0 = Disable

1 = Enable

EMIPW: EMI pulse width

000 = 1 system clock cycle

001 = 2 system clock cycles

010 = 3 system clock cycles

011 = 4 system clock cycles

100 = 5 system clock cycles

101 = 6 system clock cycles

110 = 7 system clock cycles

111 = 8 system clock cycles

EMIHT: EMI hold time

00 = 1 system clock cycle

01 = 2 system clock cycles

10 = 3 system clock cycles

11 = 4 system clock cycles

EMIST: EMI setup time

00 = 1 system clock cycle

01 = 2 system clock cycles

10 = 3 system clock cycles

11 = 4 system clock cycles

Register 11-2 EMICON1 – EMI control1

Position	7	6	5	4	3	2	1	0
Name	EMIPND	CLKSEL	OUTSEL	PWMEN	EMIDMAB		EMIDMAM	EMIM
Default	1	0	0	0	0	0	0	0
Access	RO	R/W	R/W	R/W	R/W	R/W	R/W	R/W

EMIPND: When Read EMI done flag

0 = EMI is transmitting data

1 = EMI is IDLE

When Write “0”, clear write buffer counter; write “1” affect another

CLKSEL: PWM module work clock select

0 = 24MHz

1 = 48MHz

OUTSEL: PWM output select

0 = LED anode display

1 = LED cathode display

PWMEN: PWM enable

0 = Disable

1 = Enable

EMIDMAB: EMI DMA converts byte select

00 = reserved

01 = 1 byte

10 = 2 byte

11 = 3 byte

EMIDMAM: EMI DMA mode

0 = no convert

1 = bit convert to byte

EMIM: EMI mode

0 = work when CPU kick start

1 = work with SPI1 DMA

Register 11-3 EMIBUF – EMI output buffer

Position	7	6	5	4	3	2	1	0
Name	EMIBUF							
Default	x	x	x	x	x	x	x	x

Access	WO	WO	WO	WO	WO	WO	WO	WO
--------	----	----	----	----	----	----	----	----

EMIBUF is the entrance of 6 bytes EMI output buffer. The 6 bytes EMI output buffer is emibuf0, emibuf1, emibuf2, emibuf3, emibuf4 and emibuf5. When CPU writes to EMIBUF, internal counter will add "1", CPU data is pushed corresponding buffer. You should clear internal counter by writing "0" to emicon1 bit 7;

PWM mode: should write eight times for eight channels PWM of P2

When EMIM = 0, emibuf0 will output to P2. Emibuf0 is updated with CPU write data.

When EMIM = 1 and in no convert mode, emibuf0 will output to P2. Emibuf0 is updated with SPI1 DMA data.

When SPI2EMI = 1 and in convert mode, there are 3 output modes:

Corresponding bit	0			1		
1 byte mode	emibuf0			emibuf3		
2 byte mode	emibuf0		emibuf1	emibuf3		emibuf4
3 byte mode	emibuf0	emibuf1	emibuf2	emibuf3	emibuf4	emibuf5

When EMIM = 0 and EMIEN = 1, EMI transfer will be started by writing to EMIBUF.

When EMIM = 1 and EMIEN = 1, EMI transfer will be started by SPI DMA.

PWM Operation Guide

1. Configure EMICON1 register;
2. Read data from FFT output buffer;
3. Write data to PWMDAT register.

12 Audio Terminal (DAC)

12.1 Features

CW6685X provides a high performance stereo 16-bit resolution audio DAC:

- Sample Rate 8 / 11.025 / 12 / 16 / 22.05 / 24 / 32 / 44.1 / 48KHz
- Low Clock Jitter Sensitivity
- Soft Mute and -48Db Attenuator
- Class AB headphone amplifier
- 64 Level analog Gain/attenuation from -60dB to +5dB

12.2 DAC Special Function Registers

There are 2 SFR to support DAC registers read/write function:

Register 12-1 ATADR - audio terminal address

Position	7	6	5	4	3	2	1	0
Name	DONE	DIR	ATADR					
Default	x	x	x	x	x	x	x	x
Access	RW	RW	RW	RW	RW	RW	RW	RW

DONE: read/write operation done flag

0 = read/write operation is done

1 =read/write operation is running

DIR: read/write direction select

0 =read register

1 = write register

ATADR: Address of DAC registers

Register 12-2 ATDAT - audio terminal data

Position	7	6	5	4	3	2	1	0
Name	ATDAT							
Default	x	x	x	x	x	x	x	x
Access	RW	RW	RW	RW	RW	RW	RW	RW

ATDAT:

After read operation, CPU read this register to get the data.

Before write operation, CPU writes data to this register.

12.2.1 DAC Register Mapping

Table 12-1 DAC registers address mapping:

Name	Address	Descriptions
DACCFG	0	DAC configuration register
DACSM	1	DAC soft mute configuration register
DACSPR	2	DAC sample rate register
DACVOLL	3	DAC volume setting low byte register
DACVOLH	4	DAC volume setting high byte register
DACVCON	5	DAC volume control register
TRIMCON1	6	DAC trim control register1
TRIMCON2	7	DAC trim control register2
TRREGLL	8	DAC left channel trim data register low byte
TRREGLH	9	DAC left channel trim data register high byte
TRREGRL	10	DAC right channel trim data register low byte
TRREGRH	11	DAC right channel trim data register high byte
EQCON1	12	EQ configuration register1
EQCOF	13	EQ coefficient FIFO
EQCON2	14	EQ configuration register2
EQVOLIN	15	EQ data input volume configuration register
DACLRMIX0	16	DAC L & R channel mixing coefficient 0
DACLRMIX1	17	DAC L & R channel mixing coefficient 1
DACLRMIX2	18	DAC L & R channel mixing coefficient 2
DACLRMIX3	19	DAC L & R channel mixing coefficient 3

12.2.2 Function of DAC Control Registers

Register 12-3 DACCFG - DAC configuration register

Position	7	6	5	4	3	2	1	0
Name	-	-	-		DIT_SEL	MIX_EN	OSSL	DACEN
Default	-	-	-			0	0	0
Access	-	-	-			RW	RW	RW

DIT_SEL: sdm dither signal select

0 = sine wave

1 = white noise

MIX_EN: DAC MIX enable

0 = Disabled

1 = Enabled

OSSL: DAC over sample mode select

0 = Normal speed mode

1 = Double speed mode

DACEN: DAC digital filter/delta-sigma modulator enable

0 = Disabled

1 = Enabled

Register 12-4 DACSM - DAC soft mute configuration register

Position	7	6	5	4	3	2	1	0
Name	DACSM							
Default	0	1	1	1	1	1	1	0
Access	RW	RW	RW	RW	RW	RW	RW	RW

DAC soft mute configuration, the reset value of DACSM is 126, user should not change it.

Register 12-5 DACSPR - DAC sample rate register

Position	7	6	5	4	3	2	1	0
Name	-	-	-	-	SRSEL			
Default	-	-	-	-	0	0	0	1
Access	-	-	-	-	RW	RW	RW	RW

SRSEL: DAC/FM sample rate select

0000 = 48 KHz

0001 = 44.1 KHz

0010 = 32 KHz

0011 = Reserved

0100 = 24 KHz

0101 = 22.05 KHz

0110 = 16 KHz

0111 = Reserved

1000 = 12 KHz

1001 = 11.025 KHz

1010 = 8 KHz

1011 = Reserved

1100 = 48K synchronized with OBUF (+-0.8% max)

1101 = 44.1K synchronized with OBUF (+-0.8% max)

1110 = 32K synchronized with OBUF (+-0.8% max)

1111 = 16K synchronized with OBUF (+-0.8% max)

1011 = 8K synchronized with OBUF (+-0.8% max)

Register 12-6 DACVOLH - DAC volume setting high byte register

Position	7	6	5	4	3	2	1	0
Name	DACVPND	DACVOLH						
Default	1	1	1	1	1	1	1	1
Access	RW	RW	RW	RW	RW	RW	RW	RW

DACVPND: DAC volume adjust done pending

Read "0": not done

Read “1”: done

Write “0” clear pending

Write “1” affects nothing

Register 12-7 DACVOLL– DAC volume setting low byte register

Position	7	6	5	4	3	2	1	0
Name	DACVOLL							
Default	1	1	1	1	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: When read DACVOLL and DACVOLH, the value isn't the setting value, but the actual DAC volume value

Register 12-8 DACVCON– DAC volume control register

Position	7	6	5	4	3	2	1	0
Name	-	-	-	DACVSET		DACVEN	DACVSTEP	
Default	-	-	-	0		0	0	0
Access	-	-	-	WO		R/W	R/W	R/W

DACVSET: Direct set DAC volume value

Write “1” to direct set DAC volume value

Write “0” affects nothing

DACVEN: DAC volume adjust enable

0 = Disable DAC volume adjust, keep the current volume

1 = Enable DAC volume adjust

DACVSTEP: DAC adjust volume steps

00 = Steps is “1”

01 = reserve

10 = reserve

11 = reserve

Register 12-9 TRIMCON1 - DAC trim control register1

Position	7	6	5	4	3	2	1	0
Name	TRIMSPEED		-	-	DITSEL	--	DONESEL	TRIMEN
Default	0	0	-	-	0	0	0	0
Access	RW	RW	-	-	RW	RW	RW	RW

TRIMSPEED: DAC trim speed control

00 = trim 1 step every 1 sample

01 = trim 1 step every 2 samples

10 = trim 1 step every 3 samples

11 = trim 1 step every 4 samples

DITSEL: DAC trim direction select

0 = Trim direction depend on DAC analog compare out

1 = Trim direction depend on software direction

DONESEL: trimming done condition select

0 = Depend on DAC analog compare edge

1 = Depend on match data

TRIMEN: DAC trimming enable

0 = Disabled

1 = Enabled

Register 12-10 TRIMCON2 - DAC trim control register2

Position	7	6	5	4	3	2	1	0
Name	-	-	DIRETR	DIRETL	TRIMMTL	TRIMMTR	TMDONE	TRIMKST
Default	-	-	0	0	0	0	0	0
Access	-	-	RW	RW	RW	RW	RW	RW

DIRETR: DAC right trim direction

0 = Trim data decrease one step one sample

1 = Trim data add one step one sample

DIRETL: DAC left trim direction

0 = Trim data decrease one step one sample

1 = Trim data add one step one sample

TRIMMTL: DAC left channel trimming data match

0 = Not match

1 = Match

TRIMMTR: DAC right channel trimming data match

0 = Not match

1 = Match

TMDONE: DAC trimming done

0 = Not done

1 = Done

TRIMKST: DAC trimming kick start

Write 1 to kick start DAC trimming

Register 12-11 TRREGLL - DAC left channel trim data reg low byte

Position	7	6	5	4	3	2	1	0
Name	TRIMREGLL							
Default	-	-	-	-	-	-	-	-
Access	RW	RW	RW	RW	RW	RW	RW	RW

TRIMREGLL:

Write: DAC anticipant trimming data reg low byte

Read: DAC real trimming data low byte

Register 12-12 TRREGLH - DAC left channel trim data reg high byte

Position	7	6	5	4	3	2	1	0
----------	---	---	---	---	---	---	---	---

Name	TRIMREGLH							
Default	-	-	-	-	-	-	-	-
Access	RW	RW	RW	RW	RW	RW	RW	RW

TRIMREGLL:

Write: DAC anticipant trimming data register high byte

Read: DAC real trimming data high byte

Register 12-13 TRREGRL- DAC right channel trim data reg law byte

Position	7	6	5	4	3	2	1	0
Name	TRIMREGRL							
Default	-	-	-	-	-	-	-	-
Access	RW	RW	RW	RW	RW	RW	RW	RW

TRIMREGRL:

Write: DAC anticipant trimming data register low byte

Read: DAC real trimming data low byte

Register 12-14 TRREGRH - DAC right channel trim data reg high byte

Position	7	6	5	4	3	2	1	0
Name	TRIMREGRH							
Default	-	-	-	-	-	-	-	-
Access	RW	RW	RW	RW	RW	RW	RW	RW

TRIMREGRH:

Write: DAC anticipant trimming data register high byte

Read: DAC real trimming data high byte

12.2.3 Analog Control Register

Register 12-15 ATCON0 – Analog control register 0

Position	7	6	5	4	3	2	1	0
Name	VDDHP_EN	VCMPOPS_EN	VCMINT_EN	VCMBUF_EN	VCM_EN	DBIAS_EN	BG_EN	ABIAS_EN
Default	0	0	0	0	0	1	1	0
Access	RW	RW	RW	RW	RW	RW	RW	RW

ABIAS_EN: Enable for Audio(DAC/MIC/SCADC) basing

0 = Disable

1 = Enable

BG_EN: Enable for Bandgap

0 = Disable

1 = Enable

DBIAS_EN: Enable for Digital(SRADC/PLL) basing

0 = Disable

1 = Enable

VCM_EN: Enable for VCM

0 = Disable

1 = Enable

VCMBUF_EN: Enable for VCM buffer

0 = Disable

1 = Enable

VCMINT_EN: Enable for VCM internal generation

0 = Disable

1 = Enable

VCMPOPS_EN: Enable for VCM tied to ground

0 = Disable

1 = Enable

VDDHP_EN: Enable for VDDHP

0 = Disable

1 = Enable

Register 12-16 ATCON1 – Analog control register 1

Position	7	6	5	4	3	2	1	0
Name		POPS_EN	PD_EN	VDDHP2_SEL	VDDHP1_SEL	VDDHP0_SEL	SEL_VCM1	SEL_VCM0
Default		0	0	1	0	0	1	0
Access		RW	RW	RW	RW	RW	RW	RW

SEL_VCM0: Setting for VCM control bit0

SEL_VCM1: Setting for VCM control bit1

VDDHP0_SEL: 3 bits voltage setting for VDDHP control

VDDHP1_SEL:

VDDHP2_SEL:

PD_EN: Enable for HP output weak pull down

0 = Disable

1 = Enable

POPS_EN: Enable for HP output strong pull down

0 = Disable

1 = Enable

Register 12-17 ATCON2 - Analog control register 2

Position	7	6	5	4	3	2	1	0
Name	AINLR_EN	AINR3_EN	AINR2_EN	AINL2_EN	AINR1_EN	AINL1_EN	AINR0_EN	AINL0_EN
Default	0	0	0	0	0	0	0	0
Access	RW	RW	RW	RW	RW	RW	RW	RW

AINL0_EN: Enable for LINEIN left channel path 0 to AMUX buffer

0 = Disable

1 = Enable

AINR0_EN: Enable for LINEIN right channel path 0 to AMUX buffer

0 = Disable

1 = Enable

AINL1_EN: Enable for LINEIN left channel path 1 to AMUX buffer

0 = Disable

1 = Enable

AINR1_EN: Enable for LINEIN right channel path 1 to AMUX buffer

0 = Disable

1 = Enable

AINL2_EN: Enable for LINEIN left channel path 2 to AMUX buffer

0 = Disable

1 = Enable

AINR2_EN: Enable for LINEIN right channel path 2 to AMUX buffer

0 = Disable

1 = Enable

AINR3_EN: Enable for VOUTL input to AMUX buffer

0 = Disable

1 = Enable

AINLR_EN: Enable for AMUX left right channel short together

0 = Disable

1 = Enable

Register 12-18 ATCON3 - Analog controls register 3

Position	7	6	5	4	3	2	1	0
Name	SEL_AMIC1	RONLY_SEL	RBIAS_SEL	PDHP_SEL	HPMUTE_EN	HP_EN	DACTCMP_EN	DAC_EN
Default	0	0	0	0	0	0	0	0
Access	RW	RW	RW	RW	RW	RW	RW	RW

DAC_EN: Enable for DAC quantizer

0 = Disable

1 = Enable

DACTCMP_EN: Enable for DAC trim comparator

0 = Disable

1 = Enable

HP_EN: Enable for DAC HP(headphone amplifier)

0 = Disable

1 = Enable

HPMUTE_EN: Enable for DAC HP(headphone amplifier) mute

0 = Disable

1 = Enable

PDHP_SEL: Setting for DAC pull down resistor

0 = related to DAC

1 = 3k

RBIAS_SEL: Setting biasing of DAC left channel at DAC single right channel mode

0 = Disable

1 = Enable

RONLY_SEL: DAC single right channel mode

1 = single right channel

SEL_AMIC1: Selection for MIC amplifier output to LPF input

0 = Disable

1 = Enable

Register 12-19 ATCON4 - Analog control register 5

Position	7	6	5	4	3	2	1	0
Name	GA2	GA1	GA0	GC4	GC3	GC2	GC1	GC0
Default	0	0	0	0	0	0	0	0
Access	RW	RW	RW	RW	RW	RW	RW	RW

GA2, GA1, GA0: 3 bits gain setting of input for VOUTL/R

000=+0dB

001=+1dB

010=+2dB

011=+3dB

100=+4dB

ENADC_CMP: ADC left channel input range comparator enable

0 = Disable

1 = Enable

SELADC_CMP: ADC quantizer comparator biasing selection

0=5uA

1=10uA

SELADC_VOUTP: ADC left channel input buffer positive output tie to DAC input selection

SELADC_VOUTN: ADC left channel input buffer tie to DAC selection

Register 12-30 ATCON7 - Analog controls register 7

Position	7	6	5	4	3	2	1	0
Name	SELADC_REF1	SELADC_REF0	SELADC_MIC1	SELADC_MIC0	SELADC_INT1	SELADC_INT0	SELADC_BUF1	SELADC_BUF0
Default	1	1	1	0	1	0	1	0
Access	RW	RW	RW	RW	RW	RW	RW	RW

SELADC_BUF0, SELADC_BUF1: 2 bits ADC input buffer biasing current selection

00 = 5uA

01 = 10uA

10 = 15uA

11 = 20uA;

SELADC_INT0, SELADC_INT1: 2 bits ADC sigma-delta modulator integrator biasing current selection

00 = 5uA

01 = 10uA

10 = 15uA

11 = 20uA;

SELADC_MIC0, SELADC_MIC1: 2 bits ADC MIC amplifier biasing current selection

00 = 5uA

01 = 10uA

10 = 15uA

11 = 20uA;

SELADC_REF0: ADC ref generation biasing current selection

0 = 5uA

1 = 10uA

SELADC_REF1: ADC VREF generation biasing current selection

0 = 5uA

1 = 10uA

Register 12-31 ATCON8 - Analog controls register 8

Position	7	6	5	4	3	2	1	0
Name			SELADC_DTC1	SELADC_DTC0	ENADC_VREF	ENADC_MUTE	ENADC_MIC	SELADC_VREF
Default			0	0	0	0	0	0
Access			RW	RW	RW	RW	RW	RW

SELADC_VREF: ADC VREF voltage selection

0=1.5*VCM

1=1.67*VCM

ENADC_MIC: MIC amplifier enable

0 = Disable

1 = Enable

ENADC_MUTE: Input buffer amplifier mute enable

0 = Disable

1 = Enable

ENADC_VREF: SCADC reference voltage generator enable

0 = Disable

1 = Enable

SELADC_DTC0, SELADC_DTC1: 2 bits SCADC clock to input clock delay selection

Register 12-21 KVCON1– Key Voice control

Position	7	6	5	4	3	2	1	0
Name	-	-	-	-	-	-	MPEN	KEYEN
Default	x	x	x	x	x	x	1	0
Access	x	x	x	x	x	x	R/W	R/W

KEY_DMA_ADRH: Key voice DMA high address

MPEN: MP3 is playing enable

0 = Disable MP3 play when plays key voice

1 = Enable MP3 play when plays key voice

KEYEN: Key Voice enable

0 = Disabled

1 = Enabled

Register 12-22 KVCON2– Key Voice control

Position	7	6	5	4	3	2	1	0
Name	KVCCYC[4:0]					KVV[2:0]		
Default	0	0	0	0	1	1	1	1
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

KVCON2: key voice control

KVV [2:0]: key voice volume control

000 = volume div 128

001 = volume div 64

010 = volume div 32

011 = volume div 16

100 = volume div 8

101 = volume div 4

110 = volume div 2

111 = 0db

KVCCYC [4:0]: key voice plays cycle control

The real cycle of key voice play is KVCCYC [4:0] * 8.

Register 12-23 KVCADR– Key Voice DMA address

Position	7	6	5	4	3	2	1	0
Name	KEY_DMA_ADR							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

When configure key voice DMA address, should write this register three times. First configure the DMA start high address, second configure the DMA start low address, and third configure the DMA end low address. It can only change between 0 to 0xff

12.3 Operation Guide

12.3.1 DAC Operation Guide

1. Configure DACVOLL & DACVOLH
2. Configure DACVCON
3. Clear DACVPND to kick start adjust volume

13 SARADC

13.1 Features

CW6685X provides an eight-channel moderate conversion speed and a moderate resolution 10-bit successive approximated register Analog to Digital Converter (SARADC) for users to develop applications in the following areas:

- Voice grade applications
- Audio applications requiring moderate performance
- Measurement requiring moderate performance and speed

SARADC conversion clock must be slower than 1 MHz

13.2 ADC Pin Mapping

Table 13-1 pin used

ADC Channel	Function	Description
ADC8	P26	Only for PIN detected, Not for ADKEY
ADC7	LDO Band GAP	Reference voltage 0.864V
ADC6	LDO in	1/2 Battery voltage
ADC5	P13	Normal ADC channel
ADC4	P30	Normal ADC channel
ADC3	P22	Normal ADC channel
ADC2	P14	Normal ADC channel
ADC1	P21	Normal ADC channel
ADC0	P33	Normal ADC channel

13.3 SARADC Special Function Registers

Register 13-1 ADCCON– SARADC control

Position	7	6	5	4	3	2	1	0
Name	ADCGO	EOC	TMREN	ADCTL	ADCEN	ADCSEL		
Default	0	0	x	x	0	0	0	0
Access	R/W	RO	R/W	R/W	R/W	R/W	R/W	R/W

ADCGO: ADC Conversion Start

When read:

0 = Conversion finished

1 = Conversion not finished

When write:

0 = N/A

1 = Start conversion

EOC: Check if end of conversion

0 = Finished

1 = Not finished

TMREN: Timer Input Enable

0 = Disabled

1 = Enabled

ADCTL: Timer Source Select

0 = Timer0

1 = Timer1

ADCEN: ADC Module Enable

0 = Disabled

1 = Enabled

ADCS3, ADCSEL: ADC Channel Select

0000 = P3.3 (ADC0)

0001 = P2.1 (ADC1)

0010 = P1.4 (ADC2)

0011 = P2.2 (ADC3)

0100 = P3.0 (ADC4)

0101 = P1.3 (ADC5)

0110 = 1/2 Battery voltage

0111 = LDO_BG. 0.864V

1000 = P26 (ADC8, Only for PIN detected, Not for ADKEY)

Register 13-2 ADCMODE– SARADC mode control

Position	7	6	5	4	3	2	1	0
Name	-	-	-	ADCS3	AUTOS	ADCSEL_SH		
Default	0	0	0	0	0	0	0	0
Access	RO	RO	RO	R/W	R/W	R/W	R/W	R/W

ADCS3: ADC Channel Select 3

ADCSEL_SH: ADCSEL shadow

AUTOS: Auto channel switching mode

0 = Not switch

1 = Auto load ADCSEL_SH into ADCSEL after conversion finished

Register 13-3 ADCBAUD– SARADC baud rate control

Position	7	6	5	4	3	2	1	0
Name	-	-	ADCBAUD					
Default	-	-	x	x	x	x	x	x
Access	-	-	WO	WO	WO	WO	WO	WO

ADC conversion clock = system clock / (2 x (ADCBAUD + 1))

Register 13-4 ADCDATAL– SARADC Buffer low byte control

Position	7	6	5	4	3	2	1	0
Name	ADCDATAL		-	-	-	-	-	-
Default	x	x	-	-	-	-	-	-
Access	RO	RO	-	-	-	-	-	-

Register 13-5 ADCDATAH– SARADC Buffer high byte control

Position	7	6	5	4	3	2	1	0
Name	ADCDATAH							
Default	x	x	x	x	x	x	x	x
Access	RO	RO	RO	RO	RO	RO	RO	RO

14 Integrated Interchip Sound (IIS)

14.1 Features

IIS support Direct Memory Access mode and normal write buffer mode. The use of DMA mode can greatly decrease the load of CPU. And it is very simple to use.

Table 14-1 IIS pin mapping

Function	Pin (IIS_3W==1)		Pin (IIS_3W==0)		Description
	P_SEL==0	P_SEL==1	P_SEL==0	P_SEL==1	
IISREFCLK	P16				IIS Reference Clock
IISWS	P17	P26	P17	P26	IIS Word Select
IISBCLK	P13	P25	P13	P25	IIS Bit Clock
IISDI	P06	P23	P14	P22	IIS Data In
IISDO	P14	P22	P14	P22	IIS Data Out

Figure 14-1 shows the timing figure of IIS.

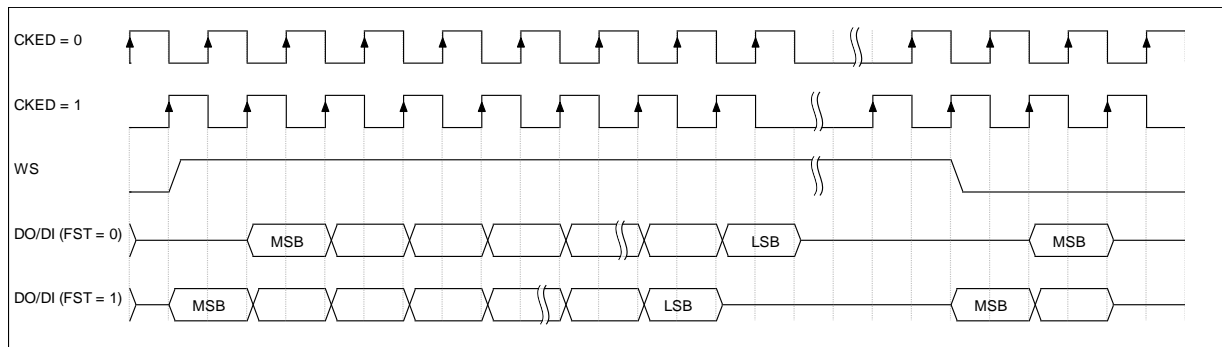

Figure 14-1 Timing of IIS in different mode

14.2 IIS Special Function Register

Register 14-1 IIS_CON0

Position	7	6	5	4	3	2	1	0
Name	DATA_FMT		CH_SEL		LTHWS	SMP_EDGE	SLAVE	IIS_EN
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

DATA_FMT:

2'b00: IIS format

2'b01: left align

2'b10: right align

CH_SEL:

2'b00: both left & right channel transfer

2'b01: only left

2'b10: only right

2'b11: reserved

LTHWS: left channel to high WS

0: left channel data to low level WS, right to high level

1: left channel data to high level WS, right to low level

SMP_EDGE: sample edge

0: right edge update data

1: low edge update data

SLAVE: IIS work at slave or Master mode

1'b0: Master mode

1'b1: Slave mode

IIS_EN: IIS enable.

Register 14-2 IIS_CON1:

Position	7	6	5	4	3	2	1	0
Name	DMA_LOOP	SMP_SYNC		IIS_3W	OP_MOD		TXRX_MOD	
Default	0	0	0	1	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

DMA_LOOP: IIS DMA data to memory, then DMA data out to IO

0: not loop

1: loop

SMP_SYNC: sample IIS_DI by IO or synchronization input

2'b00: sample IO (master mode recommended)

2'b01: sample synchronization IO input (master mode)

2'b1x: sample delay value of synchronization IO (slave mode recommended)

IIS_3W: iis DI/DO separately or not

0: not

1: separately

OP_MOD: IIS data operation mode

2'b00: data source come from cpu manual read/write

2'b01: data source come by DMA(to or from memorys)

2'b10: data source come from internal DAC output

2'b11: data source come from IO and to IO; LOOP_OP;

Transfer out the data received, Data shift_in/shift_out by IO to IO;

TXRX_MOD: IIS data transfer work mode

2'b00: enable rx only

2'b01: enable tx only

2'b10: enable rx,tx at the same time

Register 14-3 IIS_CON2: write pending and error pending configuration

Position	7	6	5	4	3	2	1	0
Name	-	EXCEPT_PND	TX_BUF_EMP	TXRX_PND	RD_OV_PND	WR_OV_PND	RD_HF_PND	WR_HF_PND
Default	-	0	0	0	0	0	0	0
Access	-	R/W	R/W	R/W	R/W	R/W	R/W	R/W

EXCEPT_PND: error flag, when ws be shorter suddenly, will cause some error.

R:1'b0: not error

1'b1: error

W:1'b0: clear

1'b1: not clear

TX_BUF_EPT: indicate tx buffer empty or not

R:0: not empty, then CPU cannot write data to send out

1: empty, CPU can write another 2 samples to send out

TXRX_PND: Some sample data have been received in or sent out

R:1'b0: not done

1'b1: done

16bit data mode, then pending up after 2 Left & Right or 4 single left or 4 single right samples done

Other bit data mode, after 1 left & right or 2 left or 2 right sample channel data done, pending up

W:1'b0: clear

1'b1: not clear

RD_OV_PND: number of dma read is equal to (IIS_DMA_CNT0~1)

R:1'b0: not finish

1'b1: finish

W:1'b0: clear

1'b1: not clear

WR_OV_PND: number of dma write is equal to (IIS_DMA_CNT0~1)

R:1'b0: not finish

1'b1: finish

W:1'b0: clear

1'b1: not clear

RD_HF_PND: number of dma read is equal to $(0.5 * \text{IIS_DMA_CNT0} \sim 1)$

R:1'b0: not finish

1'b1: finish

W:1'b0: clear

1'b1: not clear

WR_HF_PND: number of dma write is equal to $(0.5 * \text{IIS_DMA_CNT0} \sim 1)$

R:1'b0: not finish

1'b1: finish

W:1'b0: clear

1'b1: not clear

Register 14-4 IIS_CON3: read pending configuration

Position	7	6	5	4	3	2	1	0
Name	P_SEL				IIS_OV_RD_IE	IIS_OVF_WR_IE	IIS_HF_RD_IE	IIS_HF_WR_IE
Default	0				0	0	0	0
Access	R/W				R/W	R/W	R/W	R/W

P_SEL: Choose the ports of do,di,ws and bclk

1'b0: IISDO P14

IISDI P06

IIS_WS P17

IIS_BCLK P13

1'b1: IISDO P22

IISDI P23

IIS_WS P26

IIS_BCLK P25

IIS_OV_RD_IE: IIS dma read all number of data interrupt enable

1'b0: disable

1'b1: enable

IIS_OV_WR_IE: IIS dma write all number of data interrupt enable

1'b0: disable

1'b1: enable

IIS_HF_RD_IE: IIS dma read half number of data interrupt enable

1'b0: disable

1'b1: enable

IIS_HF_WR_IE: IIS dma write half number of data interrupt enable

1'b0: disable

1'b1: enable

Register 14-5 IIS_BAUD:

Position	7	6	5	4	3	2	1	0
Name	IISBAUD[7:0]							
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

BAUDRATE: Master mode Bclk generate baudrate

$BCLK = iis_clk/(BAUDRATE+1)$ or $iis_clk/(BAUDRATE+2)$

BAUDRATE should bigger than 2 and small than 0xff

Register 14-6 IIS_BCLK_CFG:

Position	7	6	5	4	3	2	1	0
Name	-		IIS_BCLK_CFG					
Default	-	-	0	0	0	0	0	0
Access	-	-	R/W	R/W	R/W	R/W	R/W	R/W

IIS_BCLK_CFG: For Master, adjust part Bclk period.

when transmit or receive bit count less than this value,BCLK period cal by $iis_clk/(BAUDRATE+1)$

when bigger or equal this value,BCLK become to $iis_clk/(BAUDRATE+2)$

e.g :

$(Fiis/Fsample)/((IIS_ALLBIT + 1)*2) = \text{quotient} + \text{remainder}$

baudrate =quotient - 1,

$IIS_BCLK_CFG = IIS_ALLBIT - \text{remainder}/2;$

NOTE: When DAC mode, if we set $Fiis=24M$, and the value of $(Fiis/Fsample)$ we use is 544;

If we set $Fiis=48MM$, and the value of $(Fiis/Fsample)$ we use is 1088;

Register 14-7 IIS_ALLBIT:

Position	7	6	5	4	3	2	1	0
Name	-		IIS_ALLBIT					
Default	-	-	0	0	0	0	0	0
Access	-	-	R/W	R/W	R/W	R/W	R/W	R/W

IIS_ALLBIT: The bclk counts inside WS L or H

User must configure this count, which is all bclks receive. During WS High or Low

Register 14-8 IIS_VALBIT:

Position	7	6	5	4	3	2	1	0
Name	-			IIS_VALBIT				
Default	-	-	0	0	0	0	0	0
Access	-	-	R/W	R/W	R/W	R/W	R/W	R/W

IIS_VALBIT: the valid receive or send bits

If IIS work at N bit mode, then write N-1 to this register.

This value should smaller than or equals to IIS_ALLBIT

Register 14-9 IIS_DAT0-7: first group of IIS buffer

Position	7	6	5	4	3	2	1	0
Name	IIS_DAT0-7							
Default	x	x	x	x	x	x	x	x
Access	R	R	R	R	R	R	R	R

IIS_DAT0-7: buffer of IIS group

Write: only write IIS_DAT0 8 times,

First write time is the highest bits

Read: read IIS_DAT0 - DAT7.

IIS_DAT0 is the highest bits, IIS_DAT7 is the lowest bits

Register 14-10 IIS_WSCNT0-1: calcute bclks between a ws period

Position	7	6	5	4	3	2	1	0
Name	IIS_WSCNT0-1							
Default	x	x	x	x	x	x	x	x
Access	R	R/W	R	R	R	R	R	R

IIS_WSCNT0-1: calculate iis_bclk between a ws period

Write: only write IIS_WSCNT1 bit(6) to enable this function;

Read:Read IIS_WSCNT0 - IIS_WSCNT1, if the result is smp_ws_cnt;

$IIS_WSCNT0 = smp_ws_cnt[7:0];$

$IIS_WSCNT = \{1'h0, smp_ws_en, smp_ws_cnt[13:8]\};$

Register 14-11 IIS_REFCLK_CFG: iis reference clk configuration

Position	7	6	5	4	3	2	1	0
Name	--	--	IIS_REFCLK_CFG					
Default	0	0	0	0	0	0	0	0
Access	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

IIS_REFCLK_CFG: iis reference clk configuration

If want to output IIS_REFCLK, the bit 5 of this register should be written 1;

The $F_{iis_refclk} = F_{iis} / (IIS_REFCLK_CFG[4:0] + 1);$

Register 14-12 IIS_ADR0:DMA write addr

Position	7	6	5	4	3	2	1	0
Name	IIS_ADR0							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

IIS_ADR0:Write two times for dma write address.

frist time is the higher address part, second time is the lower address part

Register 14-13 IIS_ADR1:DMA read addr

Position	7	6	5	4	3	2	1	0
Name	IIS_ADR1							
Default	x	x	x	x	x	x	x	x
Access	WO	WO	WO	WO	WO	WO	WO	WO

IIS_ADR1:Write two times for dma read address.

frist time is the higher address part, second time is the lower address part

Register 14-14 IIS_DMA_RD_CNT0-1:

Position	7	6	5	4	3	2	1	0
Name	IIS_DMA_RD_CNT							
Default	1	1	1	1	1	1	1	1
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

IIS_DMA_RD_CNT0-1: the counter of IIS DMA data, use for kick start DMA transfer and dma_loop mode

Write:

Firstly, write IIS_DMA_RD_CNT0 8 bits, this register is the low bits

secondly, write IIS_DMA_RD_CNT1 2 bits, this register is the high bits, write this register is the same time to kick start DMA transfer

For iis dma one time is two buffers, IIS_DMA_RD_CNT should be odd

the real data bits is : $(\{IIS_DMA_RD_CNT1, IIS_DMA_RD_CNT0\} + 1) * 16$ bits

Register 14-15 IIS_DMA_WR_CNT0-1:

Position	7	6	5	4	3	2	1	0
Name	IIS_DMA_WR_CNT							
Default	1	1	1	1	1	1	1	1
Access	W/R	W/R	W/R	W/R	W/R	W/R	W/R	W/R

IIS_DMA_WR_CNT0-1: the counter of IIS DMA data, use for kick start DMA rx and dma_loop mode

Write:

Firstly, write IIS_DMA_WR_D_CNT0 8 bits, this register is the low bits

secondly, write IIS_DMA_WR__CNT1 2 bits, this register is the high bits, write this register is the same time to kick start DMA rx

For iis dma one time is two buffers, IIS_DMA_WR_CNT should be odd

the real data bits is : $(\{IIS_DMA_WR_CNT1, IIS_DMA_WR_CNT0\} + 1) * 16$ bits

Register 14-16 IIS_DMA_RD_P_CNT0-1:

Position	7	6	5	4	3	2	1	0
Name	IIS_DMA_RD_P_CNT							
Default	1	1	1	1	1	1	1	1
Access	RO	RO	RO	RO	RO	RO	RO	RO

IIS_DMA_RD_P_CNT0-1: During the process of dma, we can know how many datas have been already read from the memory by reading these two registers.

IIS_DMA_RD_P_CNT0 is the lower bits and IIS_DMA_RD_P_CNT1 is the higher bits

Register 14-17 IIS_DMA_WR_P_CNT0-1:

Position	7	6	5	4	3	2	1	0
Name	IIS_DMA_WR_P_CNT							
Default	1	1	1	1	1	1	1	1
Access	RO	RO	RO	RO	RO	RO	RO	RO

IIS_DMA_WR_P_CNT0-1: During the process of dma, we can know how many datas have been already written to memory by reading these two registers.

IIS_DMA_WR_P_CNT0 is the lower bits and IIS_DMA_WR_P_CNT1 is the higher bits

14.3 Operation Guide

14.3.1 CPU rd/wr

- For 2-wire data mode, set IO direction, 1-wire Data input/output hardware auto control.
Configure other IO direction. Such as WS, BCLK, REFCLK (if need)
- if master mode, set BAUDRATE, IIS_BCLK_CFG, set IIS_VALBIT ,IIS_ALLBIT for different bits transfer
- Write IIS_CON0-1 for Slave mode, sample edge, LTHWS, CH_SEL, DATA_FMT, TXRX_MOD, OP_MOD, IIS_IE setting.
- enable IIS_EN kick start RX/TX or both

For data receive , if both left and right channel data available, then hardware will halt until left channel is coming.

So if first receive right channel data, hardware will ignore it.
- Write IIS_DAT0 8 times to send data out
- wait TX_BUF_EMPTY = 1,then write another 2 data to send ,if tx
- wait IIS_PND = 1,when rx mode,then read IIS_DAT0-7 out

14.3.2 Loop

This IIS support loop operation mode. that is send out data come from RX pin. And the tx data will delay 2-4 sample before really data come out. And the first 2-4 sample being send out is all 0s.must config OP_MOD=2'b11;

14.3.3 DMA mode

- conf IIS_ADR0 and IIS_ADR1
- conf IIS_BAUD,IIS_BCLK_CFG,IIS_VALBIT,IIS_ALLBIT
- conf IIS_CON0-1
- conf IIS_DMA_RD_CNT and IIS_DMA_WR_CNT to kick start dma .
- read DMA_CNT_PND which means 1 or 0.5 (IIS_DMA_CNT*16) bits data transmit had finished.

15 Bluetooth

CW6685X is a fully functional and high-performance Bluetooth Audio Player chip. It is perfectly support the Bluetooth audio player features and Bluetooth speakerphone function. The chip is based on CLASS 2 power level, using the Bluetooth 2.1 + EDR specification, and compatible with Bluetooth 3.0 and below. It supports 16-bit DAC audio output with low output noise. In addition, it also has echo cancellation function to make a perfect call quality.

15.1 Features

- Use Bluetooth 2.1 + EDR specifications, compatible with Bluetooth 3.0 and below;
- Support L2CAP/A2DP (AVCTP / AVDTP / AVCRP to receive stereo audio signal and control the Prev/Next operation of the audio transmitter by agreement
- Support HFP (Hands-free profile), equipped with a speakerphone for voice communications
- Support echo cancellation processing in HF to ensure call quality;
- Use SPI flash to store firmware and support to configure parameters and modify the applications as demands and request
- Support UART interface communication
- SBC decode for Bluetooth audio streaming
- Support Piconet

15.2 Parameters

Table 15-1 Bluetooth parameters

Items	Description
Bluetooth standard	V3.0+EDR
Temperature	-20℃ ~ +70 ℃
Storage Temperature	-40℃ ~ +150℃
Frequency Range	2402MHz ~ 2480MHz(total 79 channels)
Channel Frequency	2402+1(K-1)MHz, K=1, 2, 379
Maximum RF Transmit Power	+4dBm
Receive Sensitivity	-80dBm

Table 15-2 Operational Buck Mode parameters

Operational Mode	Minimum	Typical	Maximum
Page scan, time internal 1.28s	-	1.0mA	-
Inquiry	-	38.9 mA	-
Page scan and Inquiry	-	1.6mA	-
ACL no traffic	-	15.2mA	-
ACL with file transfer	-	30.3mA	-
SCO HV3	-	38.4 mA	-
Sleep	-	25.0uA	-

16 Characteristics

16.1 PMU Parameters

Table 16-1 PMU Parameters

Sym	Characteristics	Min	Typ	Max	Unit	Conditions
BVIN	buck input voltage	2.8	4.2	4.8	V	
VDDLDO	VDDLDO input voltage	2.8	4.2	4.8	V	
VOUT2v1	Buck output voltage		1.9		V	
VDDCORE	1.8V output voltage	-	1.8	-	V	
VDDRTC	1.8V input voltage	2.2	4.2	4.8	V	
VDDHP	3.0V output voltage		3.0		V	
VCM	1.5V output voltage		1.5		V	
RVDD	1.8V output voltage	-	1.8	-	V	
VDDIO	3.3V output voltage	-	3.3	-	V	

16.2 CORE PLL Parameters

Table 16-2 PLL Parameters

Sym	Characteristics	Min	Typ	Max	Unit	Conditions
F _{I1}	Frequency input	-	32.768	-	KHz	Low frequency OSC
F _{I2}	Frequency input	1	12	15	MHz	High frequency OSC
F _{OUT1}	Frequency output	-	48	-	MHz	
T _{LOCK1}	PLL locked time	-	2	-	ms	Use low frequency OSC as input reference
T _{LOCK2}	PLL locked time	-	0.1	-	ms	Use high frequency OSC as input reference

16.3 General purpose I/O Parameters

Table 16-3 I/O Parameters

Symbol	Description	Min	Typ	Max	Units	Conditions
V _{IL}	Low-Level input voltage	-	-	30% * VDDIO	V	VDDIO = 3.3V
V _{IH}	High-level input voltage	70% * VDDIO	-	-	V	VDDIO = 3.3V
R _{PUP0}	Internal pull-up resistor 0	2.64	3.3	3.96	KΩ	For PORT2
R _{PDN0}	Internal pull-down resistor 0	2.64	3.3	3.96	KΩ	For PORT2
R _{PUP1}	Internal pull-up resistor 1	8	10	12-	KΩ	For PORT0/1/3
R _{PDN1}	Internal pull-down resistor 1	8	10	12	KΩ	For PORT0/1/3
I _{LEVEL1}	Level1 current driving	8	-	-	mA	For PORT1
I _{LEVEL2}	Level2 current driving	24	-	-	mA	For Port1.1

16.4 Audio ADDA Parameters

Table 16-4 Audio DAC Parameters

Sym	Characteristics	Min	Typ	Max	Unit	Conditions
DAC SNR&DR		-	90	-	dB	48PIN
DAC THD+N		-	-75	-	dB	10Kohm loading
PWR _{AB}	ClassAB AMP power output	-	-	16	mW	32ohm loading
V _{PP}	Maximum output voltage	-	-	2.6	V	10Kohm loading
ADC SNR/DR		-	90	-	dB	Voice Band
ADC THD+N		-	84	-	dB	Voice Band

16.5 USB PHY Parameters

Table 16-5 USB PHY Parameters

Sym	Characteristics	Min	Typ	Max	Unit	Conditions
RDM _{PUP}	DM pull-up resistor	-	120	-	KΩ	
RDP _{PUP}	DP pull-up resistor	-	1.5	-	KΩ	
RDM _{PDN}	DM pull-up resistor	-	15	-	KΩ	
RDP _{PDN}	DP pull-up resistor	-	15	-	KΩ	

16.6 Bluetooth Parameters

Table 16-6 Bluetooth parameters

Items	Description
Bluetooth standard	V3.0+EDR
Temperature	-20℃ ~ +70℃
Storage Temperature	-40℃ ~ +150℃
Frequency Range	2402MHz ~ 2480MHz(total 79 channels)
Channel Frequency	2402+1(K-1)MHz, K=1, 2, 379
Maximum RF Transmit Power	+4dBm
Receive Sensitivity	-80dBm

Table 16-7 Operational Mode parameters

Operational Mode	Minimum	Typical	Maximum
Page scan, time internal 1.28s	-	1.0mA	-
Inquiry	-	38.9 mA	-
Page scan and Inquiry	-	1.6mA	-
ACL no traffic	-	15.2mA	-
ACL with file transfer	-	30.3mA	-
SCO HV3	-	38.4 mA	-
Sleep	-	25.0uA	-
